abstract this study presents a framework for examining the effects of higher order thinking on the achievement of allied health students enrolled in a pathophysiology course a series of clinical case studies was developed and published in an enriched online environment that guided students through the process of developing a solution and supporting it through data analysis and interpretation the series of case study modules scaffolded argumentation through question prompts the modules

began with a simple direct problem and they became progressively more complex throughout the quarter a control group was assigned a pencil and paper case study based upon recall the case studies were scored for content accuracy and evidence of higher order thinking skills higher order thinking was measured using a rubric based upon the toulmin argumentation pattern the results indicated implementing a case study of either online or traditional format was associated with significant gains in achievement the enhanced case studies were associated with modest gains in knowledge acquisition the argumentation scores across the series followed two trends directed case studies were associated with higher levels of argumentation than ill structured case studies and there appeared to be an inverse relationship between the students argumentation and content scores the protocols developed for this study can serve as a template for a larger extended investigation into student learning in the online environment
