this book brings together some of the most influential pieces of research undertaken around the world in design synthesis it is the first comprehensive work of this kind and covers all three aspects of research in design synthesis understanding what constitutes and influences synthesis the major approaches to synthesis the diverse range of tools that are created to support this crucial design task with its range of tools and methods covered it is an ideal introduction to design synthesis for those intending to research in this area as well as being a valuable source of ideas for educators and practitioners of engineering design

case based reasoning in design is becoming an important approach to computer support for design as well as an important

component in understanding the design process design has become a major focus for problem solving paradigms due to its complexity and open ended nature this book presents a clear description of how case based reasoning can be applied to design problems including the representation of design cases indexing and retrieving design cases and the range of paradigms for adapting design cases with a focus on design this book differs from others that provide a generalist view of case based reasoning this volume provides two important contributions to the area a general description of the issues and alternatives in applying case based reasoning to design and a description of specific implementations of case based design through this combination the reader will learn about both the general issues and the practical problems in supporting design through case based reasoning this book was prepared to fill a gap in the literature on the unique problems that design introduces to computational paradigms developed in computer science it also addresses the needs of computational support for design problem solving from both theoretical and practical perspectives

one of the foundations for change in our society comes from designing its genesis is the notion that the world around us either is unsuited to our needs or can be improved the need for designing is driven by a society's view that it can improve or add value to human existence well beyond simple subsistence as a consequence of designing the world which we inhabit is increasingly a designed rather than a naturally occurring one in that sense it is an artificial world designing is a fundamental precursor to manufacturing fabrication construction or implementation design research aims to develop an understanding of designing and to produce models of designing that can be used to aid designing artificial intelligence has provided an environmental paradigm within which design research based on computational constructions can be carried out design research can be carried out in variety of ways it can be viewed as largely an empirical endeavour in which experiments are designed

and executed in order to test some hypothesis about some design phenomenon or design behaviour this is the approach adopted in cognitive science it often manifests itself through the use of protocol studies of designers the results of such research form the basis of a computational model a second view is that design research can be carried out by positing axioms and then deriving consequences from them

this book contains papers on a wide range of topics in the area of kinematics mechanisms robotics and design addressing new research advances and innovations in design education the content is divided into five main categories headed historical perspectives kinematics and mechanisms robotic systems legged locomotion and design engineering education contributions take the form of survey articles historical perspectives commentaries on trends on education or research original research contributions and papers on design education this volume celebrates the achievements of professor kenneth waldrón who has made innumerable and invaluable contributions to these fields in the last fifty years his leadership and his pioneering work have influenced thousands of people in this discipline

develops the fundamental principles of active and passive network synthesis in the light of practical design considerations for engineers suitable for a basic course on network synthesis or an intermediate course on circuits
