this book provides a theoretical basis and a collection of management science tools that account for the interactions between different components of a managed forest ecosystem accounting for these interactions is the rapid evolution of forest management away from a traditional agricultural commodities production problem to a multi output problem that gives equivalent emphasis to nonmarket goods and the health of forest ecosystem itself the book is a comprehensive theoretical demonstration of the breakdown of traditional benefit cost analysis in the presence of forest ecosystem or demand interactions and is followed by a set of management science optimization procedures that address these interactions and better capture the ecosystem function discusses optimization under conditions of risk and uncertainty in forest management explores spatial optimization and multi level optimization in forest management examines joint production theory and joint cost allocation in forest management

this book presents an updated and expanded discussion of theoretical treatment of externalities i e uncompensated interdependencies public goods and club goods

this book is an introduction to mathematical game theory which might better be called the mathematical theory of conflict and cooperation it is applicable whenever two individuals or companies or political parties or nations confront situations where the outcome for each depends on the behavior of all what are the best strategies in such situations if there are chances of cooperation with whom should you cooperate and how should you share the proceeds of cooperation since its creation by john von neumann and oskar morgenstern in 1944 game theory has shed new light on business politics economics social psychology philosophy and evolutionary biology in this book its fundamental ideas are developed with mathematics at the level of high school algebra and applied to many of these fields see the table of contents ideas like fairness are presented via axioms that fair allocations should satisfy thus the reader is introduced to axiomatic thinking as well as to mathematical modeling of actual situations

the presented work combines two areas of research cooperative game theory and lot size optimization one of the most essential problems in cooperations is to allocate cooperative profits or costs among the partners the core is a well known method from cooperative game theory that describes efficient and stable profit cost allocations a general algorithm based on the idea of constraint generation to compute core elements for cooperative optimization problems is provided beside its application for the classical core an extensive discussion of core variants is presented and how they can be handled with the proposed algorithm the second part of the thesis contains several cooperative lot sizing problems of different complexity that are analyzed regarding theoretical properties like monotonicity or concavity and solved with the proposed row generation algorithm to compute core elements i e determining stable and fair cost allocations
