building around innovative services related to different modes of transport and traffic management intelligent transport systems its are being widely adopted worldwide to improve the efficiency and safety of the transportation system they enable users to be better informed and make safer more coordinated and smarter decisions on the use of transport networks current itss are complex systems made up of several components sub systems characterized by time dependent interactions among themselves some examples of these transportation related complex systems include road traffic sensors autonomous automated cars smart cities smart sensors virtual sensors traffic control systems smart roads logistics systems smart mobility systems and many others that are emerging from niche areas the efficient operation of these complex systems requires i efficient solutions to the issues of sensors actuators used to capture and control the physical parameters of these systems as well as the quality of data collected from these systems ii tackling complexities using simulations and analytical modelling techniques and iii applying optimization techniques to improve the performance of these systems

healthy ageing can lead to declines in both perceptual and cognitive functions impaired perception such as that resulting from hearing loss or reduced visual or tactile resolution increases demands on higher level cognitive functions to cope or compensate it is possible for example to use focused attention to overcome perceptual limitations unfortunately cognitive functions also decline in old age

this can mean that perceptual impairments are exacerbated by cognitive decline and vice versa but also means that interventions aimed at one type of decline can lead to improvements in the other just as improved cognition can ameliorate perceptual deficits improving the stimulus can help offset cognitive deficits for example making directions and routes easy to follow can help compensate for declines in navigation abilities in this topic we bring together papers from both auditory and visual researchers that address the interaction between perception and cognition in the ageing brain many of the studies demonstrate that a broadening of representations or increased reliance on gist underlie perceptual and cognitive age related declines there is also clear evidence that impaired perception is associated with poor cognition although encouragingly it can also be seen that good perception is associated with better cognition compensatory cognitive strategies were less successful in improving perception than might be expected we also present papers which highlight important methodological considerations that are required when studying the older brain

let  $p$  be a prime and  $s$  a finite  $p$  group a fusion system on  $s$  is a category whose objects are the subgroups of  $s$  and whose morphisms are certain injective group homomorphisms fusion systems are of interest in modular representation theory algebraic topology and local finite group theory the book provides a characterization of the 2 fusion systems of the groups of lie type and odd characteristic a result analogous to the classical involution theorem for groups the theorem is the most difficult step in a two part program the first part of the program aims to determine a large subclass of the class of simple 2 fusion systems while part two seeks to use the result on fusion systems to simplify the proof of the theorem classifying the finite simple groups

a unique unifying treatment for statistics and science in clinical trials what sets this volume apart from the many books dealing with clinical trials is its integration of statistical and clinical disciplines stressing communication between biostatisticians and clinical scientists this work clearly relates statistical interpretation to clinical issues arising in different stages of pharmaceutical research and development plus the principles presented here are universal enough to be easily adapted in non biopharmaceutical settings design and analysis of clinical trials tackles concepts and methodologies it not only covers statistical basics such as uncertainty and bias design considerations such as patient selection randomization and the different types of clinical trials but also deals with various methods of data analysis group sequential procedures for interim analysis efficacy data evaluation analysis of safety data and more throughout the book surveys current and emerging clinical issues and newly developed statistical methods presents a critical review of statistical methodologies in various therapeutic areas features case studies from actual clinical trials minimizes the mathematics involved making the material widely accessible offers each chapter as a self contained entity includes illustrations to highlight the text this monumental reference on all facets of clinical trials is important reading for physicians clinical and medical researchers pharmaceutical scientists clinical programmers biostatisticians and anyone involved in this burgeoning area of clinical research it can also be used as a textbook in graduate level courses in the field

auditory temporal processing determines our understanding of speech our appreciation of music our ability to localize a sound source and even to listen to a person in a noisy crowd sound is dynamic and as such has temporal and spectral content in disorders such as auditory neuropathy and ms problems can occur with these temporal representations of sound leading to a mismatch between auditory sensitivity and speech discrimination in dyslexia specific language impairment and auditory processing disorders similar problems occur early in life and set up additional cognitive speech processing problems it has also been found that in disorders such as autism schizophrenia and epilepsy temporal processing deficits can occur this book reviews comprehensively the mechanisms for temporal processing in the auditory system looking at how these underlie specific clinical disorders with implications for their treatment written by a prolific researcher in auditory neuroscience this book is valuable for auditory neuroscientists audiologist neurologists and speech language pathologists
