For the 6th edition of this highly regarded textbook devoted to lipids, the title has been modified from *Lipid Biochemistry* to *Lipids* to acknowledge the coming together of biological and medical sciences, the increasingly blurred boundaries between them, and the growing importance of lipids in diverse aspects of science and technology. The principal aims of this new edition to inform students and researchers about lipids, to assist teachers and encourage further research, have not changed since previous editions. Significant advances in lipid science have demanded yet another extensive rewriting for this edition, with the addition of two new authors to cover new knowledge of genes coding for proteins involved in lipid metabolism, the many lipids involved in cell signalling, the roles of lipids in health and disease, and new developments in biotechnology in support of agriculture and industry. An introductory chapter summarizes the types of lipids covered and their identification and provides a guide to the contents. Chapters contain boxes illustrating special topics, key point summaries, and suggested further reading. *Lipids*, sixth edition, provides a huge wealth of information for upper level students of biological and clinical sciences, food science and nutrition, and for professionals working in academic and industrial research libraries in all universities and research establishments where biological, medical, and food and nutritional sciences are studied and taught. Should have copies of this excellent and comprehensive new edition on their shelves.

in the preface to the second edition we made a prediction that many exciting developments would take place in the coming years that would change the face of a new edition this has indeed been the case and the current edition reflects these new advances our picture of the structure of the fatty acid synthetase has changed dramatically bringing a new concept in enzymology the multicatalytic

polypeptide chain this new knowledge owes much to the exploitation of genetic mutants the use of which is undoubtedly going to extend into many other areas of lipid biochemistry an understanding of the control of lipid metabolism has also advanced considerably during the last decade and we have tried to reflect that here although it will be some years before a truly integrated picture can be obtained for this reason we have continued to deal with the control of particular aspects of lipid metabolism fatty acids triacylglycerols lipoprotein in the specific chapters but we can foresee the time when a chapter on the overall integration of lipid metabolism will be appropriate and feasible as a particular example the exciting new concepts of the control of cholesterol metabolism in specific tissues via the interaction of low density lipoproteins with cell surface receptors have been described in chapter 6
