 reference for those involved in the business of spaceflight what sets this book apart is that nearly  
 all of the theoretical mathematics is followed by discussions of practical applications  
 implemented in tested software routines for example the book includes a compendium of  
 algorithms that allow students and professionals to determine orbits with high precision using a  
 pc without a doubt when an astrodynamics problem arises in the future it will become standard  
 practice for engineers to keep this volume close at hand and look it up in vallado while the first

 number of reasons why the second edition will be even more so there are many reworked  
 examples and derivations newly introduced topics include ground illumination calculations moon  
 rise and set and a listing of relevant internet sites there is an improved and expanded discussion  
 of coordinate systems orbit determination and differential correction perhaps most important is

that all of the software routines described in the book are now available for free in fortran pascal and c this makes the second edition an even more valuable text and superb reference

the first edition of this book was voted winner of the 2004 international academy of astronautics life sciences award the second edition deals with psychological psychiatric and psychosocial issues that affect people who live and work in space unlike other books that focus on anecdotal reports and ground based simulation studies this book emphasizes the findings from psychological research conducted during actual space missions both authors have been active in such research

essential spaceflight dynamics and magnetospherics describes in the first instance some of the key aspects of celestial mechanics and spaceflight dynamics it begins with classical two and three body problems illustrative of the aesthetic aspects of applying analytical methods of investigation to celestial mechanics then osculating orbital elements are introduced as well as analysis techniques sufficient to evaluate the influence of various disturbing forces on spacecraft next a theory of manoeuvres is outlined and the methodology of making interplanetary trajectory corrections ideas involving various approaches to orbital element determinations using measured data are also considered the forces applied to a spacecraft can result in the development of torques that influence attitude motion and the effects of the most important of these are described in terms of equilibrium positions periodic motions steady state and transient motions also considered is the problem of attitude control of a spacecraft using active and or passive methods of orientation and stabilization in addition a more advanced treatment of the development of attitude control systems is provided
