the marktoberdorf summer school 1995 logic of computation was the 16th in a series of advanced study institutes under the sponsorship of the nato scientific affairs division held in marktoberdorf its scientific goal was to survey recent progress on the impact of logical methods in software development the courses dealt with many different aspects of this interplay where major progress has been made of particular importance were the following the proofs as programs paradigm which makes it possible to extract verified programs directly from proofs here a higher order logic or type theoretic setup of the underlying language has developed into a standard extensions of logic programming e g by allowing more general formulas and or higher order languages proof theoretic methods which provide tools to deal with questions of feasibility of computations and also to develop a general mathematical understanding of complexity questions rewrite systems and unification again in a higher order context closely related is the now well established grabner basis theory which recently has found interesting applications category theoretic and more generally algebraic methods and techniques to analyze the semantics of programming languages all these issues were covered by a team of leading researchers their courses were grouped under the following headings

improved geospatial instrumentation and technology such as in laser scanning has now resulted in millions of data being collected e g point clouds it is in realization that such huge amount of data requires efficient and robust mathematical solutions that this third edition of the book extends the second edition by introducing three new chapters robust parameter estimation multiobjective optimization and symbolic regression furthermore

the linear homotopy chapter is expanded to include nonlinear homotopy these disciplines are discussed first in the theoretical part of the book before illustrating their geospatial applications in the applications chapters where numerous numerical examples are presented the renewed electronic supplement contains these new theoretical and practical topics with the corresponding mathematica statements and functions supporting their computations introduced and applied this third edition is renamed in light of these technological advancements

this book provides an introduction to various aspects of algebraic statistics with the principal aim of supporting master s and phd students who wish to explore the algebraic point of view regarding recent developments in statistics the focus is on the background needed to explore the connections among discrete random variables the main objects that encode these relations are multilinear matrices i e tensors the book aims to settle the basis of the correspondence between properties of tensors and their translation in algebraic geometry it is divided into three parts on algebraic statistics multilinear algebra and algebraic geometry the primary purpose is to describe a bridge between the three theories so that results and problems in one theory find a natural translation to the others this task requires from the statistical point of view a rather unusual but algebraically natural presentation of random variables and their main classical features the third part of the book can be considered as a short almost self contained introduction to the basic concepts of algebraic varieties which are part of the fundamental background for all who work in algebraic statistics

algebraic geometry is the study of systems of polynomial equations in one or more variables asking such questions as does the system have finitely many solutions and if so how can one find them and if there are infinitely many solutions how can they be described and manipulated the solutions of a system of polynomial equations form a geometric object called a variety the corresponding algebraic object is an ideal there is a close relationship between ideals and varieties which reveals the intimate link between algebra and geometry written at a level appropriate to undergraduates this book covers such topics as the hilbert basis theorem the nullstellensatz invariant theory projective geometry and dimension theory the algorithms to answer questions such as those posed above are an important part of algebraic geometry this book bases its discussion of algorithms on a generalization of the division algorithm for polynomials in one variable that was only discovered in the 1960 s although the algorithmic roots of algebraic geometry are old the computational aspects were neglected earlier in this century this has changed in recent years and new algorithms coupled with the power of fast computers have let to some interesting applications for example in robotics and in geometric theorem proving in preparing a new edition of ideals varieties and algorithms the authors present an improved proof of the buchberger criterion as well as a proof of bezout s theorem appendix c contains a new section on axiom and an update about maple mathematica and reduce

this pocket sized guide provides a convenient listing of all mathematica commands it is updated for mathematica 2 0 and meets the needs of all

mathematica users brief descriptions of each command are followed by simple examples of how to use the command in question the commands are organized by function

this book addresses the use of mathematica as a symbolic manipulator a programming language and a general tool for knowledge representation the main focus of the book however is on the use of mathematica as a programming language

this volume contains the fifty nine research papers presented at the 1997 international symposium on symbolic and algebraic computation the symposium was held in wailea on the island of maui hawaii usa july 21 23 1997 under the sponsorship of the acm special interest group in symbolic and algebraic manipulation sigsam and the special interest group on numerical mathematics signum the fifty nine papers contained in this volume together with the two invited talks at the symposium represent original research in all areas of symbolic and algebraic computation
