this book is a collection of problems with detailed solutions which will prove valuable to students and research workers in mathematics physics engineering and other sciences the topics range in difficulty from elementary to advanced level almost all the problems are solved in detail and most of them are self contained all relevant definitions are given students can learn important principles and strategies required for problem solving teachers will find this text useful as a supplement since important concepts and techniques are developed through the problems the material has been tested in

the author's lectures given around the world the book is divided into two volumes volume i presents the introductory problems for undergraduate and advanced undergraduate students in volume ii the more advanced problems together with detailed solutions are collected to meet the needs of graduate students and researchers the problems included cover most of the new fields in theoretical and mathematical physics such as lax representation backlund transformation soliton equations lie algebra valued differential forms the hirota technique the painleve test the bethe ansatz the yang baxter relation chaos fractals complexity etc

this volume studies the basic equations of kinetic theory in all of space it contains up to date state of the art treatments of initial value problems for the major kinetic equations including the boltzmann equation from rarefied gas dynamics and the vlasov poisson vlasov maxwell systems from plasma physics this is the only existing book to treat boltzmann type problems and vlasov type problems together although these equations describe very different phenomena they share the same streaming term the author proves that solutions starting from a given configuration at an initial time exist for all future times by imposing appropriate hypotheses on the initial values in several important cases he emphasizes those questions that a mathematician would ask first is there a solution to this problem is it unique can it be numerically approximated the topics treated include the study of the boltzmann collision operator the study of the initial value problem for the boltzmann equation with small and near equilibrium data global smooth solvability of the initial value problem for the vlasov poisson system with smooth initial data of unrestricted size conditions under which the initial value problem for the vlasov maxwell system has global in time solutions in both the smooth and weak senses and more
