healthcare decision makers in search of reliable information that compares health interventions increasingly turn to systematic reviews for the best summary of the evidence. Systematic reviews identify, select, assess, and synthesize the findings of similar but separate studies and can help clarify what is known and not known about the potential benefits and harms of drugs, devices, and other healthcare services. Systematic reviews can be helpful for clinicians who want to integrate research findings into their daily practices for patients to make well-informed choices about their own care, for professional medical societies, and other organizations that develop clinical practice guidelines. Too often, systematic reviews are of uncertain or poor quality; there are no universally accepted standards for developing systematic reviews, leading to variability in how conflicts of interest and biases are handled, how evidence is appraised, and the overall scientific rigor of the process. In finding what works in health care, the Institute of Medicine (IOM) recommends 21 standards for developing high-quality systematic reviews of comparative effectiveness research. The standards address the entire systematic review process, from the initial steps of formulating the topic and building the review team to producing a detailed final report that synthesizes what the evidence shows and where knowledge gaps remain. Finding what works in health care also proposes a framework for improving the quality of the science underpinning systematic reviews. This book will serve as a vital resource for both sponsors and producers of systematic reviews of comparative effectiveness research.

In order to determine the quality of the available services, it is important to examine both the age and sophistication of medical technologies. In addition to considering the size of inventories, the answer is particularly relevant in light of the \$3 billion the federal government has transferred to the provinces since 2000 in an effort to improve the availability of medical technology in Canada. Canada Department of Finance (2007a) Lichtenberg estimated the increase in the mean age at death resulting from the use of new laboratory procedures to be approximately 6 months, or 4.2 percent of the total increase of 1.18 years in the mean age at death observed over the period in the sample of diseases. For instance, Canada ranked twenty-first out of 28 OECD nations in the availability of computed tomography (CT) scanners, nineteenth out of 22 in the availability of lithotriptors (a machine that employs ultrasound to break up stones in the body), and nineteenth out of 27 in the availability of magnetic resonance imagers (MRIs). The report indicated that technological change for heart attack care has differed in many ways across countries. In Canada, the study found is considered a late adopter in the use of intensive procedures and was classified as one of the 12. The nature and magnitude of technological change were noted to be systematically related to the economic and regulatory incentives in a country's health care.
