this book describes the mathematical background behind discrete approaches to morphological analysis of scalar fields with
a focus on morse theory and on the discrete theories due to banchoff and forman the algorithms and data structures
presented are used for terrain modeling and analysis molecular shape analysis and for analysis or visualization of sensor and
simulation 3d data sets it covers a variety of application domains including geography geology environmental sciences
medicine and biology the authors classify the different approaches to morphological analysis which are all based on the
construction of morse or morse smale decompositions they describe algorithms for computing such decompositions for

both 2d and 3d scalar fields including those based on the discrete watershed transform also addressed are recent developments in the research on morphological shape analysis such as simplification operators for morse and morse smale complexes and their multi resolution representation designed for professionals and researchers involved with modeling and algorithm analysis morphological modeling of terrains and volume data is a valuable resource advanced level students of computer science mathematics and geography will also find the content very helpful
