this monograph is devoted to the identification and measurement theory of costs and benefits in a fuzzy information environment the process of cost benefit analysis is presented requiring the development of real cost benefit databases and the construction of cost benefit criterion these steps are accomplished with various theoretical constructs that provide sets of self contained algorithms for application this book integrates cost benefit analysis theory of fuzzy decisions and social decisions into unified decision algorithms accessible to practitioners researchers and graduate students it features the essentials of fuzzy mathematics and algorithms in a comprehensive way exposing a multi disciplinary approach for the development of cost benefit decision making in the framework of fuzziness and soft computing

this book presents the elaboration model for the multivariate analysis of observational quantitative data this model entails the systematic introduction of third variables to the analysis of a focal relationship between one independent and one dependent variable to ascertain whether an inference of causality is justified two complementary strategies are used an exclusionary strategy that rules out alternative explanations such as spuriousness and redundancy with competing theories and an inclusive strategy that connects the focal relationship to a network of other relationships including the hypothesized causal mechanisms linking the focal independent variable to the focal dependent variable the primary emphasis is on the translation of theory into a logical analytic strategy and the interpretation of results the elaboration model is applied with case studies drawn from newly published research that serve as prototypes for aligning theory and the data analytic plan used to test it these studies are drawn from a wide range of substantive topics in the social sciences such as emotion management in the workplace subjective age identification during the transition to adulthood and the relationship between religious and paranormal beliefs the second application of the elaboration model is in the form of original data analysis presented in two analysis journals that are integrated throughout the text and implement the full elaboration model using real data not contrived examples the text provides a step by step guide through the process of integrating theory with data analysis in order to arrive at meaningful answers to research questions

this book is first of all designed as a text for the course usually called theory of functions of a real variable this course is at present customarily offered as a first or second year graduate course in united states universities although there are signs that this sort of analysis will soon penetrate upper division undergraduate curricula we have included every topic that we think essential for the training of analysts and we have also gone down a number of interesting bypaths we hope too that the book will be useful as a reference for mature mathematicians and other scientific workers hence we have presented very general and complete versions of a number of important theorems and constructions since these sophisticated versions may be difficult for the beginner we have given elementary avatars of all important theorems with appropriate suggestions for skipping we have given complete definitions explanations and proofs throughout so that the book should be usable for individual study as well as for a course text prerequisites for reading the book are the following the reader is assumed to know elementary analysis as the subject is set forth for example in tom m apostol s mathematical analysis addison wesley publ co reading mass 1957 or walter rudin s principles of mathematical analysis 2nd ed mcgraw hill book co new york 1964
