modern embedded systems require high performance low cost and low power consumption such systems typically consist of a heterogeneous collection of processors specialized memory subsystems and partially programmable or fixed function components this heterogeneity coupled with issues such as hardware software partitioning mapping scheduling etc leads to a large number of design possibilities making performance debugging and validation of such systems a difficult problem embedded systems are used to control safety critical applications such as flight control automotive electronics and healthcare monitoring clearly developing reliable software systems for such applications is of utmost importance this book describes a host of debugging and verification methods which can help to achieve this goal covers the major abstraction levels of embedded systems design starting from software analysis and micro architectural modeling to modeling of resource sharing and communication at the system level integrates formal techniques of validation for hardware software with debugging and validation of embedded system design flows includes practical case studies to answer the questions does a design meet its requirements if not then which parts of the system are responsible for the violation and once they are identified then how should the design be suitably modified

this preface pertains to three issues that we would like to bring to the attention of the readers our objectives our intended audience and the nature of the material we have in mind several objectives the first is to establish a framework for dealing with uncertainties in software engineering and for using quantitative measures for decision making in this context the second is to bring into perspective the large body of work having statistical content that is relevant to software engineering which may not have appeared in the traditional outlets devoted to it connected with this second objective is a desire to streamline and organize our own thinking and work in this area our third objective is to provide a platform that facilitates an interface between computer scientists and statisticians to address a class of problems in computer science it appears that such an interface is necessary to provide the needed synergism for solving some difficult problems that the subject poses our final objective is to serve as an agent for stimulating more cross disciplinary research in computer science and statistics to what extent the material here will meet our objectives can only be assessed with the passage of time our intended audience is computer scientists software engineers and reliability analysts who have some exposure to probability and statistics applied statisticians interested in reliability problems are also a segment of our intended audience
