developments in geotechnical engineering volume 7 limit analysis and soil plasticity covers the theory and applications of limit analysis as applied to soil mechanics organized into 12 chapters the book presents an introduction to the modern development of theory of soil plasticity and includes rock like material the first four chapters of the book describe the technique of limit analysis beginning with the historical review of the subject and the assumptions on which it is based and then covering various aspects of available techniques of limit analysis the subsequent chapters deal with the applications of limit analysis to what may be termed classical soil mechanics problems that include bearing capacity of footings lateral earth pressure problems and stability of slopes in many cases comparisons of limit analysis solution and conventional limit equilibrium and slip like solutions are also presented other chapters deal with the advances in bearing capacity problem of concrete blocks or rock and present theoretical and experimental results of various concrete bearing problems the concluding chapter examines elastic plastic soil and elastic plastic fracture models for concrete materials this book is an ideal resource text to geotechnical engineers and soil mechanics researchers

common feature is that these evolution problems can be formulated as asymptotically small perturbations of certain dynamical systems with better known behaviour now it

usually happens that the perturbation is small in a very weak sense hence the difficulty or impossibility of applying more classical techniques though the method originated with the analysis of critical behaviour for evolution pdes in its abstract formulation it deals with a nonautonomous abstract differential equation $u_t + Au + c u = 0$ where u has values in a Banach space like an L^p space A is an autonomous time independent operator and c is an asymptotically small perturbation so that $c u \rightarrow 0$ along orbits $u(t)$ of the evolution in a sense to be made precise which in practice can be quite weak we work in a situation in which the autonomous limit differential equation $u_t + Au = 0$ has a well known asymptotic behaviour and we want to prove that for large times the orbits of the original evolution problem converge to a certain class of limits of the autonomous equation more precisely we want to prove that the orbits of the nonautonomous equation are attracted by a certain limit set Ω of the autonomous equation or it can be a more complicated object
