together with volume vi of the transactions on rough sets series this book commemorates the life and work of zdzislaw pawlak 1926 2006 it presents papers that reflect the profound influence of a number of research initiatives by professor pawlak introducing a number of advances in the foundations and applications of ai engineering logic mathematics and science which have had significant implications in a number of research areas

this book is the first comprehensive tutorial on matheuristics matheuristics are based on mathematical extensions of previously known heuristics mainly metaheuristics and on original area specific approaches this tutorial provides a detailed discussion of both contributions presenting the pseudocodes of over 40 algorithms abundant literature references and for each case a step by step description of a sample run on a common generalized assignment problem example c source codes of all algorithms are available in an associated sw repository

rough set theory introduced by pawlak in the early 1980s has become an important part of soft computing within the last 25 years however much of the focus has been on the theoretical understanding of rough sets with a survey of rough sets and their applications within business and industry much desired rough sets selected methods and applications in management and engineering provides context to rough set theory with each chapter exploring a real world application of rough sets rough sets is relevant to managers striving to improve their businesses industry researchers looking to improve the efficiency of their solutions and university researchers wanting to apply rough sets to real world problems

this book constitutes the thoroughly refereed post conference proceedings of the 5th international conference on learning and intelligent optimization lion 5 held in rome italy in january 2011 the 32 revised regular and 3 revised short papers were carefully reviewed and selected from a total of 99 submissions in addition to the contributions to

the general track there are 11 full papers and 3 short papers presented at the following four special sessions: intelligent multiobjective optimization, performance prediction, self-eas, self-tuning, self-configuring, and self-generating evolutionary algorithms, swap software, and applications.

In light of increasing economic and international threats, military operations must be examined with a critical eye in terms of process design, management improvement, and control. Although the Pentagon and militaries around the world have utilized industrial engineering concepts to achieve this goal for decades, there has been no single reso-

This volume constitutes the refereed proceedings of the 9th International Symposium on Experimental Algorithms (SEA 2010) held on Ischia Island, Naples, Italy, in May 2010. The 40 revised full papers presented together with two invited papers were carefully reviewed and selected from 73 submissions. The topics covered include: algorithm engineering, algorithmic libraries, algorithmic mechanism design, analysis of algorithms, algorithms for memory hierarchies, approximation techniques, bioinformatics, branch and bound algorithms, combinatorial and irregular problems, combinatorial structures and graphs, communication networks, complex networks, computational geometry, computational learning theory, computational optimization, computer systems, cryptography and security, data streams, data structures, distributed and parallel algorithms, evaluation of algorithms for realistic environments, experimental techniques and statistics, graph drawing, heuristics for combinatorial optimization.

This comprehensive book provides the students with the basic knowledge of the processes involved in operations research and discusses the techniques of solutions to problems and their applications in daily life. Beginning with an overview of the operations research models and decision making, the book describes in detail the various optimization techniques such as linear and non-linear programming, integer linear programming, dynamic programming, genetic programming, and network techniques such as PERT, program evaluation review technique, and CPM (critical path method). It also explains the transportation and assignment problems, queueing theory, games theory, sequencing, replacement, and capital investment decisions, and inventory. Besides the book discusses the Monte Carlo simulation techniques for solving queueing, demand forecasting, inventory, and scheduling problems and elaborates on genetic algorithms. Each mathematical technique is dealt with in two parts: the first part explains the theory underlying the methodology of solution to problems; the second part illustrates how the theory is applied to solve different kinds of problems. This book is designed as a textbook for the undergraduate students of mechanical engineering, electrical engineering, production and industrial engineering, computer science and engineering, and information technology. Besides the book will also be useful to the postgraduate students of

production and industrial engineering computer applications business administration commerce mathematics and statistics key features includes a large number of solved problems to help students comprehend the concepts with ease gives step by step explanation of algorithms by taking problems provides chapter end exercises to drill the students in self study
