this is the third in a series of conferences devoted primarily to the theory and applications of artificial neural networks and genetic algorithms the first such event was held in innsbruck austria in april 1993 the second in ales france in april 1995 we are pleased to host the 1997 event in the mediaeval city of norwich england and to carry on the fine tradition set by its predecessors of providing a relaxed and stimulating environment for both established and emerging researchers working in these and other related fields this series of conferences is unique in recognising the relation between the two main themes of artificial neural networks and genetic algorithms each having its origin in a natural process fundamental to life on earth and each now well established as a paradigm fundamental to continuing technological development through the solution of complex industrial commercial and financial problems this is well illustrated in this volume by the numerous applications of both paradigms to new and challenging problems the third key theme of the series therefore is the integration of both technologies either through the use of the genetic algorithm to construct the most effective network architecture for the problem in hand or more recently the use of neural networks as approximate fitness functions for a genetic algorithm searching for good solutions in an incomplete solution space i e one for which the fitness is not easily established for every possible solution instance

experimentation is necessary a purely theoretical approach is not reasonable the new experimentalism a development in the modern philosophy of science considers that an experiment can have a life of its own it provides a statistical methodology to learn from experiments where the experimenter should distinguish between statistical significance and scientific meaning this book introduces the new experimentalism in evolutionary computation providing tools to understand algorithms and programs and their interaction with optimization problems the book develops and applies statistical techniques to analyze and compare modern search heuristics such as evolutionary algorithms and particle swarm optimization treating optimization runs as experiments the author offers methods for solving complex real world problems that involve optimization via simulation and he describes successful applications in engineering and industrial control projects the book bridges the gap between theory and experiment by providing a self contained experimental methodology and many examples so it is suitable for practitioners and researchers and also for lecturers and students it summarizes results from the author s consulting to industry and his experience teaching university courses and conducting tutorials at international conferences the book will be supported online with downloads and exercises

The aircraft design process is a complex, highly iterative, time-consuming process that contributes significantly to the overall engineering cost. Aircraft specifications including performance, weight, cost, and other aspects must be addressed to create an effective design. The multidisciplinary nature of the engineering process, which includes design analysis and manufacturing, follows a regimented path that is initiated by preliminary design, evolves into a preliminary design, and is followed by a detailed design for production. Many critical design decisions are made at the conceptual level where the least amount of information is available to assist in the design evaluation and tradeoffs. The objective of this effort is the development of a comprehensive design environment for modeling and simulating the aircraft systems, seamlessly integrating different engineering processes. The system architecture will support a single underlying object-oriented architecture with demand-driven computation and dependency tracking that allows information to feed forward and backward among various engineering processes as the design evolves.
