anderson s book provides the most accessible approach to compressible flow for mechanical and aerospace engineering students and professionals in keeping with previous versions the 3rd edition uses numerous historical vignettes that show the evolution of the field new pedagogical features roadmaps showing the development of a given topic and design boxes giving examples of design decisions will make the 3rd edition even more practical and user friendly than before the 3rd edition strikes a careful balance between classical methods of determining compressible flow and modern numerical and computer techniques such as cfd now used widely in industry research a new book website will contain all problem solutions for instructors

the utah geological survey ugs developed these guidelines to help geologists evaluate debris flow hazards on alluvial fans to ensure safe development debris flow hazard evaluations are particularly important because alluvial fans are the primary sites of debris flow deposition and are also favored sites for development the purpose of a debris flow hazard evaluation is to characterize the hazard and provide design parameters for risk reduction the ugs recommends critical facilities and structures for human occupancy not be placed in active debris flow travel and deposition areas unless the risk is reduced to an acceptable level these guidelines use the characteristics of alluvial fan deposits as well as drainage basin and feeder channel sediment supply conditions to evaluate debris flow hazards the hazard evaluation relies on the geomorphology sedimentology and stratigraphy of existing alluvial fan deposits analysis of alluvial fan deposits provides the geologic basis for estimating frequency and potential volume of debris flows and describing debris flow behavior drainage basin and feeder channel characteristics determine potential debris flow susceptibility and the volume of stored channel sediment available for sediment bulking in future flows
