this monograph is based on 20 years of research with patients who have experienced pathology in one hemisphere of the brain it deals with brain mechanisms in human communicative behavior and with related motor functions from a broadly biological point of view in so doing the work discusses the possible evolutionary origins of human communication the relation of brain mechanisms in communicative behavior to analogous nonhuman behaviors and the neural systems involved in various levels and kinds of communication in addition noncommunicative mechanisms which parallel those used in communication such as manual and oral praxis and constructional behavior are outlined in detail individual differences in brain organization for such functions related to hand preference and sex are also explored although there is extensive reference to central nervous system pathology the emphasis throughout is on how the findings contribute to understanding normal brain mechanisms much new data is presented along with the theoretical treatment of human communication which emphasizes a behavioral rather than a linguistic approach this in turn provides continuity with nonhuman primates and early hominids the work will interest psycholinguists cognitive psychologists neurologists clinical neuropsychologists speech pathologists and advanced students in these fields

with an appendix containing a full analysis of the debts of the united states the several states municipalities etc also statements of street railway and traction companies industrial corporations etc statement omitted on later vols

left right asymmetries of structure and function are a common organization principle in the brains of humans and non human vertebrates alike while there are inherently asymmetric systems such as the human language system or the song system of songbirds the impact of structural or functional asymmetries on perception cognition and behavior is not necessarily limited to these systems for example performance in experimental paradigms that assess executive functions such as inhibition planning or action monitoring is influenced by information processing in the bottom up channel depending on the type of stimuli used one hemisphere can be more efficient in processing than the other and these functional cerebral asymmetries have been shown to modulate the efficacy of executive functions via the bottom up channel we only begin to understand the complex neuronal mechanisms underlying this interaction between hemispheric asymmetries and cognitive systems therefore it is the aim of this research topics to further elucidate how structural or functional hemispheric asymmetries modulate perception cognition and behavior in the broadest sense

the latest edition is presented of the systems characteristics and programming manual of the illiac 4 array and parallel disc memory system the major aspects of the array described include the array systems characteristics programming characteristics definition and flow charts and timing a glossary of terms and an instruction index are included
