service oriented computing has become one of the predominant factors in it research and development efforts over the last few years in spite of several standardization efforts that advanced from research labs into industrial strength technologies and tools there is still much human effort required in the process of finding and executing services here dieter fensel and his team lay the foundation for understanding the semantic services infrastructure aimed at eliminating human intervention and thus allowing for seamless integration of information systems they focus on the currently most advanced sws infrastructure namely sesa and related work such as the services execution environment wsmx activities and the semantic execution environment oasis see tc standardization effort their book is divided into four parts part i provides an introduction to the field and its history covering basic technologies and the state of research and standardization in the semantic field part ii presents the sesa architecture the authors detail its building blocks and show how they are consolidated into a coherent software architecture that can be used as a blueprint for implementation part iii gives more insight into middleware services describing the necessary conceptual functionality that is imposed on the architecture through the basic principles each such functionality is realized using a number of so called middleware services finally part iv shows how the sesa architecture can be applied to real world scenarios and provides an overview of compatible and related systems the book targets professionals as well as academic and industrial researchers working on various aspects of semantic integration of distributed information systems they will learn how to apply the semantic services infrastructure to automate and semi automate tasks by using existing integration technologies in addition the book is also suitable for advanced graduate students enrolled in courses covering knowledge management the semantic or integration of information systems as it will educate them about basic technologies for semantic services and general issues related to integration of information systems

what is this book about this is a book about services services are still more like a movement than a mature technology the movement is motivated by a vision of a semi auto mated that can support long chains of interactions between autonomous agents there are three important components to that vision one is interoperabil ity a service can have clients agents from any platform in any language another is autonomy an agent can discover the services it needs from their published descriptions that include both what the service can do and how it does it the interfaces of available actions the third is semi automatic code creation one description can be used by a development framework to automate the creation of code for clients and by the services

themselves as of today interoperability is close to full realization with only occasional glitches autonomy is a distant vision but it still has problems interoperability has been achieved code creation is useful in part by using an xml based high level protocol soap for message exchanges between clients and services as long as the client can produce messages in the right format it doesn t matter what language they re written in or on what platform they run the first three chapters of our book show how to write platform independent services clients in javascript and java running from within a browser ie6 or mozilla
