biological activity for most living organisms is at its highest where the percolation transition occurs hence finding such temperature range was of utmost importance after having found such temperature interval i e between 310k and 330k conformational studies were performed on full length human and rat islet amyloid polypeptide hiapp and riapp respectively by md simulations both for the reduced and oxidized iapp moieties studying the monomeric forms of two very similar polypeptides that present different amyloidogenic properties could shed light on the aggregation mechanism of human islet amyloid polypeptide in fact after hundreds of nanoseconds above the percolation transition temperature oxidized hiapp folded into a compact structure that was about 10 smaller than the average value of the radius of gyration further studies were carried out on some in silico mutated hiapp moieties in order to pinpoint key residues involved in the folding of hiapp three conditions were needed in order to observe this compact state the presence of the disulfide bond the absence of the p28 residue found in rat iapp presence of aromatic residues in particular f23

many drugs and other xenobiotics e g preservatives insecticides and plastifiers contain hydrolyzable moieties such as ester or amide groups in biological media such foreign compounds are therefore important substrates for hydrolytic reactions catalyzed by hydrolases or proceeding non enzymatically despite their significance until now no book has been dedicated to hydrolysis and hydrolases in the metabolism of drugs and other xenobiotics this work fills a gap in the literature and reviews metabolic reactions of hydrolysis and hydration from the point of views of enzymes substrates and reactions
