the handbook of discrete and computational geometry is intended as a reference book fully accessible to  
nonspecialists as well as specialists covering all major aspects of both fields the book offers the most important

results and methods in discrete and computational geometry to those who use them in their work both in the academic world as researchers in mathematics and computer science and in the professional world as practitioners in fields as diverse as operations research molecular biology and robotics discrete geometry has contributed significantly to the growth of discrete mathematics in recent years this has been fueled partly by the advent of powerful computers and by the recent explosion of activity in the relatively young field of computational geometry this synthesis between discrete and computational geometry lies at the heart of this handbook a growing list of application fields includes combinatorial optimization computer aided design computer graphics crystallography data analysis error correcting codes geographic information systems motion planning operations research pattern recognition robotics solid modeling and tomography

while we were busy putting together the present collection of articles celebrating the twentieth birthday of our journal discrete computational geometry and in a way of the eld that has become known under the same name two more

years have elapsed there is no doubt that dcg has crossed the line between childhood and adulthood by the mid 1980s it became evident that the solution of many algorithmic questions in the then newly emerging field of computational geometry required classical methods and results from discrete and combinatorial geometry for instance visibility and ray shooting problems arising in computer graphics often reduce to Helly type questions for line transversals the complexity hardness of a variety of geometric algorithms depends on McMullen's upper bound theorem on convex polytopes or on the maximum number of halving lines determined by  $2n$  points in the plane that is the number of different ways a set of points can be cut by a straight line into two parts of the same size proximity questions stemming from several application areas turn out to be intimately related to Erdős's classical questions on the distribution of distances determined by  $n$  points in the plane or in space on the other hand the algorithmic point of view has fertilized several fields of convexity and of discrete geometry which had lain fallow for some years and has opened new research directions

discrete and computational geometry are two fields which in recent years have benefitted from the interaction between mathematics and computer science the results are applicable in areas such as motion planning robotics scene analysis and computer aided design the book consists of twelve chapters summarizing the most recent results and methods in discrete and computational geometry all authors are well known experts in these fields they give concise and self contained surveys of the most efficient combinatorial probabilistic and topological methods that can be used to design effective geometric algorithms for the applications mentioned above most of the methods and results discussed in the book have not appeared in any previously published monograph in particular this book contains the first systematic treatment of epsilon nets geometric transversal theory partitions of euclidean spaces and

a general method for the analysis of randomized geometric algorithms apart from mathematicians working in discrete and computational geometry this book will also be of great use to computer scientists and engineers who would like to learn about the most recent results

this volume is a collection of refereed expository and research articles in discrete and computational geometry written by leaders in the field articles are based on invited talks presented at the ams ims siam summer research conference discrete and computational geometry ten years later held in 1996 at mt holyoke college so hadley ma topics addressed range from tilings polyhedra and arrangements to computational topology and visibility problems included are papers on the interaction between real algebraic geometry and discrete and computational geometry as well as on linear programming and geometric discrepancy theory
