this book is an introduction to the simple math patterns used to describe  
fundamental stable spectral orbital physical systems represented as discrete

hyperbolic shapes the containment set has many dimensions and these dimensions possess macroscopic geometric properties which are discrete hyperbolic shapes thus it is a description that transcends the idea of materialism i e it is higher dimensional and it can also be used to model a life form as a unified high dimension geometric construct which generates its own energy and which has a natural structure for memory where this construct is made in relation to the main property of the description being the spectral properties of both material systems and of the metric spaces that contain the material systems where material is simply a lower dimension metric space and where both material components and metric spaces are in resonance with the containing space

this insightful book gives suggestions on increasing academic rigor of the middle school male student increasing consistent student attendance and decreasing discipline referrals this book gives situational examples and possible suggestions to help single parents teachers administrators board members and the male student to overcome obstacles to be successful washington believes that bonding should initially take place early in the relationship of the teacher to student and student to teacher much like a client coming to a store for specific items the store owner has to get to know his customer in order to effectively serve this individual for continued customer satisfaction the same principles apply for teachers getting to know their students oftentimes this notion is not developed because of constant new initiatives being introduced to teachers without lasting results hence mentoring of students can eliminate many problems schools face using the suggestions offered in this book will cause increase academic performance and attendance while decreasing discipline referrals tremendously

includes section recent publications

this book is about a fundamental re organization of language which is used in regard to describing the stable many but few body spectral orbital systems from nuclei to planetary systems which now have no valid descriptions based on what are called the laws of physics the current description based on partial differential equations results in non linear non commutative and an improperly identified and improperly used random basis for physical description the result is that the properties of stability which are observed for these systems have not been describable in such a context on the other hand the already identified math patterns of geometrization along with e noethers symmetries which allow the stable set of discrete hyperbolic shapes to be identified with energy spaces as well as the many dimensional structure in which these stable shapes of any size are defined as identified by d coxeter are patterns

which can be used to form a new context for physical description this is what this book is about forming such a new context wherein the stable many but few body spectral system is formulated and accurately described ie it is solved in such a new context partial differential equations come to play a subordinate role to stable shapes and their relation to defining a finite stable spectral set which is a property of the new many dimensional containment set a property which determines which stable patterns can exist but there are many social forces which oppose such a discussion these opposing social forces are also discussed t

explores the nature of infinity with a view toward classifying and explaining its mathematical applications it presents not only the basics of the classical theory but also an introduction to the many important recent results and methods
