how do scientists persuade colleagues from diverse fields to cross the disciplinary divide risking their careers in new interdisciplinary research programs why do some attempts to inspire such research win widespread acclaim and support while others do not in shaping science with rhetoric leah ceccarelli addresses such questions through close readings of three scientific monographs in their historical contexts theodosius dobzhansky's genetics and the origin of species 1937 which inspired the modern synthesis of evolutionary biology erwin schrödinger's what is life 1944 which catalyzed the field of molecular biology and edward o wilson's consilience 1998 a so far not entirely successful attempt to unite the social and biological sciences she examines the rhetorical strategies used in each book and evaluates which worked best based on the reviews and scientific papers that followed in their wake ceccarelli's work will

be important for anyone interested in how interdisciplinary fields are formed from historians and rhetoricians of science to scientists themselves

conservation genetics focuses on understanding the role and requirement of genetic variation for population persistence however considerable debate now surrounds the role of genetic factors as opposed to non genetic factors such as habitat destruction etc in population extinction and a comprehensive synthesis is now timely can extinction be explained by habitat destruction alone or is lack of genetic variation a part of the explanation the book thoroughly reviews the arguments for a role of genetics in the present biodiversity crisis it describes the methods used to study genetic variation in endangered species and examines the influence of genetic variation in the extinction of species to date conservation genetics has predominantly utilized neutral genetic markers e g microsatellites however with the recent advances in molecular genetics and genomics it will soon be possible to study direct gene action following the fate of genetic variation at the level of dna through expression to proteins in order to determine how such phenotypes fare in populations of free living organisms evolutionary conservation genetics explores these exciting avenues of future research potential integrating ecological quantitative genetics with the new genome science it is now more important than ever that we ask relevant questions about the evolutionary fate of endangered populations throughout the globe and incorporate our knowledge of evolutionary processes and the distribution of genetic diversity into effective conservation planning and action

at the first international symposium on aquatic oligochaete biology in sidney b c the suggestion was made to hold the second in pallanza on lake maggiore at the c n r istituto italiano di idrobiologia at the same time it was decided that there should be a symposium every third year

the organization of the symposium was made considerably easier by the senior editor s having been in personal contact with several russian colleagues courtesy of a kind invitation from the u s s r academy of sciences the hamburg group and the junior editor correspondence with various students of oligochaeta also furnished many useful suggestions the second international symposium on aquatic oligochaete biology was therefore held in pallanza in late september 1982 and was attended by 53 scientists from 16 countries in europe north america asia and australia no review papers were formally invited as this had already been done at the first symposium all the papers were accordingly allotted the same time for oral presentation these proceedings contain all papers hrabe and slepukhina which were given in absentia as it presented at the symposium including those by was impossible for the authors to join the group the main topics were taxonomy and evolution of oligochaeta life cycle and population studies the role of oligochaeta in assessing water pollution physiological studies community and distribution studies special taxonomic workshops took place in the evenings
