classical euclidean geometry with all its triangles circles and inscribed angles remains an excellent playground for high school mathematics students even if it looks outdated from the professional mathematician's viewpoint it provides an excellent choice of elegant and natural problems that can be used in a course based on problem solving the book contains more than 750 mostly easy but nontrivial problems in all areas of plane geometry and solutions for most of them as well as additional problems for self study some with hints each chapter also provides concise reminders of basic notions used in the chapter so the book is almost self contained although a good textbook and competent teacher are always recommended more than 450 figures illustrate the problems and their solutions the book can be used by motivated high school students as well as their teachers and parents after solving the problems in the book the student will have mastered the main notions and methods of plane geometry and hopefully will have had fun in the process in the interest of fostering a greater awareness and appreciation of mathematics and its connections to other disciplines and everyday life msri and the ams are publishing books in the mathematical circles library series as a service to young people their parents and teachers and the mathematics profession what a joy shen's geometry in problems is a gift to the school teaching world beautifully organized by content topic shen has collated a vast collection of fresh innovative and highly classroom relevant questions problems and challenges sure to enliven the minds and clever thinking of all those studying euclidean geometry for the first time this book is a spectacular resource for educators and students alike users will not only sharpen their mathematical understanding of specific topics but will also sharpen their problem solving wits and come to truly own the mathematics explored also math circle leaders can draw much inspiration for session ideas from the material presented in this book james tanton mathematician at large mathematical association of america we learn mathematics best by doing mathematics the author of this book recognizes this principle he invites the reader to participate in learning plane geometry through carefully chosen problems with brief explanations leading to much activity the problems in the book are sometimes deep and subtle almost everyone can do some of them and almost no one can do all the reader comes away with a view of geometry refreshed by experience mark saul director of competitions mathematical association of america

this is a challenging problem solving book in euclidean geometry assuming nothing of the reader other than a good deal of courage topics covered included cyclic quadrilaterals power of a point homothety triangle centers along the way the reader will meet such classical gems as the nine point circle the simson line the symmedian and the mixtilinear incircle as well as the theorems of euler ceva menelaus and pascal another part is dedicated to the use of complex numbers and barycentric coordinates granting the reader both a traditional and computational viewpoint of the material the final part consists of some more advanced topics such as inversion in the plane the cross ratio and projective transformations and the theory of the complete quadrilateral the exposition is friendly and relaxed and accompanied by over 300 beautifully drawn figures the emphasis of this book is placed squarely on the problems each chapter contains carefully chosen worked examples which explain not only the solutions to the problems but also describe in close detail how one would invent the solution to begin with the text contains as selection of 300 practice problems of varying difficulty from contests around the world with extensive hints and selected solutions this book is especially suitable for students preparing for national or international mathematical olympiads or for teachers looking for a text for an honor class

describing two cornerstones of mathematics this basic textbook presents a unified approach to algebra and geometry it covers the ideas of complex numbers scalar and vector products determinants linear algebra group theory permutation groups symmetry groups and aspects of geometry including groups of isometries rotations and spherical geometry the book emphasises the interactions between topics and each topic is constantly illustrated by using it to describe and discuss the others many ideas are developed gradually with each aspect presented at a time when its importance becomes clearer to aid in this the text is divided into short chapters each with exercises at the end the related website features an html version of the book extra text at higher and lower levels and more exercises and examples it also links to an electronic maths thesaurus giving definitions examples and links both to the book and to external sources
