nitrous oxide  $\text{N}_2\text{O}$  is the third most important in global warming terms of the greenhouse gases after carbon dioxide and methane as this book describes although it only comprises 320 parts per billion of the earth's atmosphere it has a so called global warming potential nearly 300 times greater than that of carbon dioxide  $\text{N}_2\text{O}$  emissions are difficult to estimate because they are predominantly biogenic in origin the  $\text{N}_2\text{O}$  is formed in soils and oceans throughout the world by the microbial processes of nitrification and denitrification that utilise the reactive N compounds ammonium and nitrate respectively these forms of nitrogen are released during the natural biogeochemical nitrogen cycle but are also released by human activity in fact the quantity of these compounds entering the biosphere has virtually doubled since the beginning of the industrial age and this increase has been matched by a corresponding increase in  $\text{N}_2\text{O}$  emissions the largest source is now agriculture driven mainly by the use of synthetic nitrogen fertilisers the other major diffuse source derives from release of NOx into the atmosphere from fossil fuel combustion and biomass burning as well as ammonia from livestock manure some  $\text{N}_2\text{O}$  also comes directly from combustion and from two processes in the chemical industry the production of nitric acid and the production of adipic acid used in nylon manufacture action is being taken to curb the industrial point source emissions of  $\text{N}_2\text{O}$  but measures to limit or reduce agricultural emissions are inherently more difficult to devise as we enter an era in which measures are being explored to reduce fossil fuel use and or capture or sequester the  $\text{CO}_2$  emissions from the fuel it is likely that the relative importance of  $\text{N}_2\text{O}$  in the Kyoto basket of greenhouse gases will increase because comparable mitigation measures for  $\text{N}_2\text{O}$  are inherently more difficult and because expansion of the land area devoted to crops to feed the increasing global population and to accommodate the current development of biofuels is likely to lead to an increase in N fertiliser use and thus  $\text{N}_2\text{O}$  emission worldwide the aim of this book is to provide a synthesis of scientific information on the primary sources and sinks of nitrous oxide and an assessment of likely trends in atmospheric concentrations over the next century and the potential for mitigation measures

since the first edition of nitrogen in the marine environment was published in 1983 it has been recognized as the standard in the field in the time since the book first appeared there has been tremendous growth in the field with unprecedented discoveries over the past

decade that have fundamentally changed the view of the marine nitrogen cycle as a result this second edition contains twice the amount of information that the first edition contained this updated edition is now available online offering searchability and instant multi user access to this important information the classic text fully updated to reflect the rapid pace of discovery provides researchers and students in oceanography chemistry and marine ecology an understanding of the marine nitrogen cycle available online with easy access and search the information you need when you need it
