the standard introductory texts to mathematical statistics leave the bayesian approach to be taught later in advanced topics courses giving students the impression that bayesian statistics provide but a few techniques appropriate in only special circumstances nothing could be further from the truth argues dale poirier who has developed a course for teaching comparatively both the classical and the bayesian approaches to econometrics poirier s text provides a thoroughly modern self contained comprehensive and accessible treatment of the probability and statistical foundations of econometrics with special emphasis on the linear regression model written primarily for advanced undergraduate and graduate students who are pursuing research careers in economics intermediate statistics and econometrics offers a broad perspective bringing together a great deal of diverse material its comparative approach emphasis on regression and prediction and numerous exercises and references provide a solid foundation for subsequent courses in econometrics and will prove a valuable resource to many nonspecialists who want to update their quantitative skills the introduction closes with an example of a real world data set the challengerspace shuttle disaster that motivates much of the text s theoretical discussion the ten

chapters that follow cover basic concepts special distributions distributions of functions of random variables sampling theory estimation hypothesis testing prediction and the linear regression model appendixes contain a review of matrix algebra computation and statistical tables

this highly acclaimed text now available in paperback provides a thorough account of key concepts and theoretical results with particular emphasis on viewing statistical inference as a special case of decision theory information theoretic concepts play a central role in the development of the theory which provides in particular a detailed discussion of the problem of specification of so called prior ignorance the work is written from the authors s committed bayesian perspective but an overview of non bayesian theories is also provided and each chapter contains a wide ranging critical re examination of controversial issues the level of mathematics used is such that most material is accessible to readers with knowledge of advanced calculus in particular no knowledge of abstract measure theory is assumed and the emphasis throughout is on statistical concepts rather than rigorous mathematics the book will be an ideal source for all students and researchers in statistics mathematics decision analysis economic and business studies and all branches of science and engineering who wish to further their understanding of bayesian statistics

in recent years significant progress has been made in statistical theory new methodologies have emerged as an attempt to bridge the gap between theoretical and applied approaches this volume presents some of these developments which already have had a significant impact on modeling design and analysis of statistical experiments the chapters cover a wide range of topics of current interest in applied as well as theoretical statistics and probability they include some aspects of the design of experiments in which there are current developments regression methods decision theory nonparametric theory simulation and computational statistics time series reliability and queueing networks also included are chapters on some aspects of probability theory which apart from their intrinsic mathematical interest have significant applications in statistics

the revision of this well respected text presents a balance of the classical and bayesian methods the theoretical and practical sides of both probability and statistics are considered new content areas include the vorel kolmogorov paradox confidence bands for the regression line the correction for continuity and the delta method
