this introductory text combines models from physics and biology with rigorous reasoning in describing the theory of ordinary

differential equations along with applications and computer simulations with maple offering a concise course in the theory of ordinary differential equations it also enables the reader to enter the field of computer simulations thus it is a valuable read for students in mathematics as well as in physics and engineering it is also addressed to all those interested in mathematical modeling with ordinary differential equations and systems contents part i theory chapter 1 first order differential equations chapter 2 linear differential systems chapter 3 second order differential equations chapter 4 nonlinear differential equations chapter 5 stability of solutions chapter 6 differential systems with control parameters part ii exercises seminar 1 classes of first order differential equations seminar 2 mathematical modeling with differential equations seminar 3 linear differential systems seminar 4 second order differential equations seminar 5 gronwall s inequality seminar 6 method of successive approximations seminar 7 stability of solutions part iii maple code lab 1 introduction to maple lab 2 differential equations with maple lab 3 linear differential systems lab 4 second order differential equations lab 5 nonlinear differential systems lab 6 numerical computation of solutions lab 7 writing custom maple programs lab 8 differential systems with control parameters

this book is an introduction to machine learning with a strong focus on the mathematics behind the standard algorithms and techniques in the field aimed at senior undergraduates and early graduate students of mathematics there is a focus on well known supervised machine learning algorithms detailing the existing theory to provide some theoretical guarantees featuring intuitive proofs and exposition of the material in a concise and precise manner a broad set of topics is covered giving an overview of the field a summary of the topics covered is statistical learning theory approximation theory linear models kernel methods gaussian processes deep neural networks ensemble methods and unsupervised learning techniques such as clustering and dimensionality reduction this book is suited for students who are interested in entering the field by preparing them to master the standard tools in machine learning the reader will be equipped to understand the main theoretical questions of the current research and to engage with the field

the purpose of this book is to present results on the subject of weak convergence in function spaces to study invariance principles in statistical applications to dependent random variables u statistics censor data analysis different techniques formerly available only in a broad range of literature are for the first time presented here in a self contained fashion contents weak convergence of stochastic

processes weak convergence in metric spaces weak convergence on $C[0, 1]$ and $D[0, \infty)$ central limit theorem for semi martingales and applications central limit theorems for dependent random variables empirical process bibliography

this book offers an introduction to concepts of probability theory probability distributions relevant in the applied sciences as well as basics of sampling distributions estimation and hypothesis testing as a companion for classes for engineers and scientists the book also covers applied topics such as model building and experiment design contents random phenomenon probability random variable expected values commonly used discrete distributions commonly used density functions joint distributions some multivariate distributions collection of random variables sampling distribution estimation interval estimation tests of statistical hypotheses model building and regression design of experiments and analysis of variance questions and answers

this book is an introduction to financial mathematics it is intended for graduate students in mathematics and for researchers working in academia and industry the focus on stochastic models in discrete time has two immediate benefits first the probabilistic machinery is simpler and one can discuss right away some of the key problems in the theory of pricing and hedging of financial derivatives second the paradigm of a complete financial market where all derivatives admit a perfect hedge becomes the exception rather than the rule thus the need to confront the intrinsic risks arising from market incompleteness appears at a very early stage the first part of the book contains a study of a simple one period model which also serves as a building block for later developments topics include the characterization of arbitrage free markets preferences on asset profiles an introduction to equilibrium analysis and monetary measures of financial risk in the second part the idea of dynamic hedging of contingent claims is developed in a multiperiod framework topics include martingale measures pricing formulas for derivatives american options superhedging and hedging strategies with minimal shortfall risk this fourth newly revised edition contains more than one hundred exercises it also includes material on risk measures and the related issue of model uncertainty in particular a chapter on dynamic risk measures and sections on robust utility maximization and on efficient hedging with convex risk measures contents part i mathematical finance in one period arbitrage theory preferences optimality and equilibrium monetary measures of risk part ii dynamic hedging dynamic arbitrage theory american contingent claims superhedging efficient hedging hedging under constraints minimizing the hedging error dynamic risk measures

this book is mainly intended as a textbook for students at the sophomore junior level majoring in mathematics engineering or the sciences in general the book includes the basic topics in ordinary differential equations normally taught in an undergraduate class as linear and nonlinear equations and systems besel functions laplace transform stability etc it is written with ample exibility to make it appropriate either as a course stressing applications or a course stressing rigor and analytical thinking this book also offers sufficient material for a one semester graduate course covering topics such as phase plane analysis oscillation sturm liouville equations euler lagrange equations in calculus of variations first and second order linear pde in 2d there are substantial lists of exercises at the ends of chapters a solutions manual containing complete and detailed solutions to all the exercises in the book is available to instructors who adopt the book for teaching their classes
