toprovethe correctness of a program is to demonstrate through impeccable mathematical techniques that it has no bugs to test a program is to run it with the exp tation of discovering bugs the two techniques seem contradictory if you have proved your program it is fruitless to comb it for bugs and if you are testing it that is surely a sign that you have given up on any hope of proving its corre ness accordingly proofs and tests have since the onset of software engineering research been pursuedby distinct communities using ratherdi erent techniques and tools and yet the development of both approaches leads to the discovery of common issues and to the realization that each may need the other the emergence of model checking has been one of the rst signs that contradiction may yield to complementarity but in the past few years an increasing number of research e orts have encountered the need for combining proofs and tests dropping earlier dogmatic views of incompatibility and taking instead the best of what each of these software engineering domains has to o er
