the shift register counter is a device comprised of a small number of digital flip flops interconnected to emit a long predetermined nonrepeating series of binary bits the theory of their design is examined concentrating on the synthesis of counters able to create extremely long sequences by sequentially modifying the effective connections or operators in the feedback loops non linear shift registers are examined from several different points of view and then the insight so afforded is applied to generalize upon the possible directions which might yield maximal length sequences with a minimum of equipment author

this volume is concerned with the individual steps in the pathway of retrovirus morphogenesis and maturation starting at the point where the components of the virion have been synthesized within the infected cell and ending once the infectious virion has been released from this cell an introductory chapter provides a comparative description of the structure and morphology of infectious viruses a novel feature is the organization according to individual steps in the pathway of virus particle formation rather than according to individual viruses or virus groups as has been done in most previous reviews this novel concept should allow a comparative discussion of the similarities and differences within this complex virus family regarding the specific aspects of formation of an infectious virion
