when we think about expertise we usually consider people who master tasks at a level not reachable by most other people although we rarely realise it however most humans are experts in many aspects of everyday life this expertise enables us to find our way through a complex environment that is our life for instance we can instantly recognise multiple objects and relations between them to form a meaningful unit such as an office thus research on expertise is not only important to investigate the cognitive and neural processes within an elite group but it is also a powerful tool to understand how everyone can acquire complex skills the goal of this research topic is to shed further light on the common and distinct neural mechanisms that implement various kinds of expertise we broadly define expertise as skill in any perceptual cognitive social or motor domain with the common core being optimised information processing due to knowledge acquired from repeated experiences thus we are interested in the full range of mental processes modulated or modified by expertise from simple object or pattern recognition to complex decision making or problem solving in a particular domain these domains can range from everyday or occupational

expertise to sports and rather artificial domains such as board games in all cases the aim should be to elucidate how the brain implements these sometimes incredible feats we are particularly interested in connecting cognitive theories about expertise and expertise related performance differences with models and data on the neural implementation of expertise we welcome original research contributions using the full range of behavioural neuroscience methods as well as theoretical methodological or historical reviews and opinion papers focusing on any of the above mentioned aspects

the purpose of this book is to provide a smooth transition from linear elasticity through the nonlinear behaviour induced by unilateral constraints to full scale plasticity it presents applications of mathematical programming to nonlinear static analysis of skeletal structures trusses frames grillages etc it is demonstrated that under the assumption of small displacements a broad class of structural analysis problems exhibit the same internal structure such is the case with elastic analysis in the presence of unilateral supports or tension only members elastic plastic analysis in both holonomic and non holonomic formulations and finally ultimate load analysis throughout the book a clear and uniform methodology of presentation is used first a complete set of governing relations is derived for a particular problem then that set is shown to be equivalent to a certain minimax problem the

saddle point problem that in turn can be replaced by a pair of constrained extremum problems dual mp problems thus the complementary energy principles are established furnishing the basis for the development of methods of numerical solution
