the primary objective of this study was to investigate the conversion of chicken fat and tall oil both individually and in a blend into biodiesel the conventional base catalyzed method of biodiesel production has shown to be inappropriate for the conversion of high free fatty acid containing feedstocks such as tall oil due to the undesired saponification reaction that takes place likewise the acid catalyzed method of biodiesel production has been shown to be inappropriate for the conversion of triglyceride containing feedstocks such as chicken fat due to the long reaction times and large excess of methanol required therefore an alternate reaction pathway was investigated for these two very different feedstocks supercritical methanol treatment which requires no separate catalyst was the method chosen following the development of proper protocol both chicken fat and tall oil fatty acids were reacted in supercritical methanol to produce biodiesel under a matrix of

temperatures and methanol to feed stock ratios results indicate that the chicken fat and tall oil fatty acids can be converted successfully in a single step with yields in excess of 89 out of 91 max and 94 respectively the optimum temperature and excess methanol was determined and the results suggest the use of a two step process involving the initial hydrolysis of triglyceride containing feeds followed by the supercritical esterification of the resulting existing free fatty acids the results of one such test proved to be satisfactory and are reported herein furthermore crude tall oil was also tested in the system to investigate its viability as a biodiesel feedstock with limited success cold flow properties such as viscosity and cloud point are reported for the resultant fuels the viscosities of all of the fuels exceeded the astm d6751 acceptable specifications for biodiesel therefore blending with other biodiesel fuels such as methyl soyate would be required for widespread use of the fuels produced under the conditions reported herein as commercial biodiesel

this volume helps fill the gap left from insufficiently archived details of family planning programs carried out in many developing countries from the 1950s through the 1980s of their operations their commonalities and their differences with much useful information and informed analysis the programs were complex undertakings in difficult settings that had little prior experience to draw upon not surprisingly as the case studies described here demonstrate no single strategy was available that could be employed across these diverse situations and procedures that

were successful in one country did not necessarily function well in another the case studies also indicate that developing a successful program was as much an art as a science the key ingredient was being able to distinguish when a somewhat radical new approach was needed and when only some fine tuning was necessary while not a focus of this book the family planning programs had several important indirect effects on the field of population studies that merit attention as part of the record first uncertainty about the programs worth and how to measure the extent of their success spurred a great deal of research on the measuring and modeling of fertility and contraceptive practice on fecundity issues on the effect of marriage patterns on fertility and on a host of related topics second the programs greatly advanced the science of evaluation third the programs led demographers to work with specialists from many other disciplines including public health economics sociology political science and psychology finally the family planning efforts attracted many new and talented people to the field of population studies the 23 case studies presented here were the earliest national efforts to establish organized family planning programs for entire populations the resulting chapters naturally vary in terms of their balance of history analysis and personal reflections given the wide diversity of national contexts and program types the study s overall conclusion is that for the most part the family planning program experiment worked policy and program interventions contributed substantially to the revolutionary rise of contraceptive use and to the decline in fertility that has occurred in the developing world in the past three decades
