this book constitutes the proceedings of the third international conference on networked digital technologies held in macau china in july 2011 the 41 revised papers presented were carefully reviewed and selected from 127 submissions the papers are organized in topical sections on information security networks information management multimedia human computer interaction and simulation e learning and e government services semantics user centric information system intelligent computing and data mining

building around innovative services related to different modes of transport and traffic management intelligent transport systems its are being widely adopted worldwide to improve the efficiency and safety of the transportation system they enable users to be better informed and make safer more coordinated and smarter decisions on the use of transport networks current itss are complex systems made up of several components sub systems characterized by time dependent interactions among themselves some examples of these transportation related complex systems include road traffic sensors autonomous automated cars smart cities smart sensors virtual sensors traffic control systems smart roads logistics systems smart mobility systems and many others that are emerging from niche areas the efficient operation of these complex systems requires i efficient solutions to the issues of sensors actuators used to capture and control the physical parameters of these systems as well as the quality of data collected from these systems ii tackling complexities using simulations and analytical modelling techniques and iii applying optimization techniques to improve the performance of these systems

efficient auditory processing requires the rapid integration of transient sensory inputs this is exemplified in human speech perception in which long stretches of a complex acoustic signal are typically processed accurately and essentially in real time spoken language thus presents listeners auditory systems with a considerable challenge even when acoustic input is clear however auditory processing ability is frequently compromised due to congenital or acquired hearing loss or altered through background noise or assistive devices such as cochlear implants how does loss of sensory fidelity impact neural processing efficiency and health how does this ultimately influence behavior this research topic explores the neural consequences of hearing loss including basic processing carried out in the auditory periphery computations in subcortical nuclei and primary auditory cortex and higher level cognitive processes such as those involved in human speech perception by pulling together data from a variety of disciplines and perspectives we gain a more complete picture of the acute and chronic consequences of hearing loss for neural functioning

to develop a science of hearing that is intellectu the five day conference was held at the mote ally satisfying we must first integrate the diverse marine laboratory in sarasota florida may extensive body of comparative research into an 24 1990 the invited participants came from the evolutionary context the need for this integra fields of comparative anatomy physiology biophys tion and a conceptual framework in which it could ics animal behavior psychophysics evolutionary be structured were demonstrated in landmark biology ontogeny and paleontology before the papers by van bergeijk in 1967 and wever in 1974 conference preliminary manuscripts of the invited however not since 1965 when the american papers were distributed to all participants this facilitated even encouraged discussions through society of zoologists sponsored an evolutionary conference entitled the vertebrate ear has there out the conference which could be called among other things lively the preview of papers along been a group effort to assemble and organize our current knowledge on the evolutionary as with the free exchange of information and opinion opposed to comparative biology of hearing also helped improve the quality and consistency of in the quarter century since that conference the final manuscripts included in this volume there have been major changes in evolutionary in addition to the invited papers several studies concepts e g punctuated equilibrium in sys were presented as posters during evening sessions

a unique unifying treatment for statistics and science in clinical trials what sets this volume apart from the many books dealing with clinical trials is its integration of statistical and clinical disciplines stressing communication between biostatisticians and clinical scientists this work clearly relates statistical interpretation to clinical issues arising in different stages of pharmaceutical research and development plus the principles presented here are universal enough to be easily adapted in non biopharmaceutical settings design and analysis of clinical trials tackles concepts and

methodologies it not only covers statistical basics such as uncertainty and bias design considerations such as patient selection randomization and the different types of clinical trials but also deals with various methods of data analysis group sequential procedures for interim analysis efficacy data evaluation analysis of safety data and more throughout the book surveys current and emerging clinical issues and newly developed statistical methods presents a critical review of statistical methodologies in various therapeutic areas features case studies from actual clinical trials minimizes the mathematics involved making the material widely accessible offers each chapter as a self contained entity includes illustrations to highlight the text this monumental reference on all facets of clinical trials is important reading for physicians clinical and medical researchers pharmaceutical scientists clinical programmers biostatisticians and anyone involved in this burgeoning area of clinical research it can also be used as a textbook in graduate level courses in the field
