agriculture is rightly blamed as a major culprit of our climate crisis but in this groundbreaking new book eric toensmeier argues that agriculture specifically the subset of practices known as carbon farming can and should be a linchpin of a global climate solutions platform

expert system technology is receiving increasing popularity and acceptance in the engineering community this is due to the fact that there actually exists a close match between the capabilities of the current generation expert systems and the

requirements of engineering practice prepared by a distinguished team of experts this book provides a balanced state of the art presentation of the design principles of engineering expert systems and a representative picture of their capabilities to assist efficiently the design diagnosis and operation of complex industrial plants among the application areas covered are the following hardware synthesis industrial plant layout design fault diagnosis process control image analysis computer communication electric power systems intelligent control robotics and manufacturing systems the book is appropriate for the researcher and the professional the researcher can save considerable time in searching the scattered technical information on engineering expert systems the professional can have readily available a rich set of guidelines and techniques that are applicable to a wide class of engineering domains

accelerator health physics tackles the importance of health physics in the field of nuclear physics especially to those involved with the use of particle accelerators the book first explores concepts in nuclear physics such as fundamental particles radiation fields and the responses of the human body to radiation exposure the book then shifts to its intended purpose and discusses the uses of particle accelerators and the radiation they emit the measurement of the radiation fields radiation detectors the history design and application of accelerator shielding and measures in the implementation of a health physics program the text is recommended for health physicists who want to learn more about particle accelerators their effects and how these effects can be prevented the book is also beneficial to physicists whose work involves particle accelerators as the book aims to educate them about the hazards they face in the workplace

rock salt formations have long been recognized as a valuable resource not only for salt mining but for construction of oil and gas storage caverns and for isolation of radioactive and other hazardous wastes current interest is fast expanding towards construction and re use of solution mined caverns for storage of renewable energy in the form of hydrogen compressed air and other gases evaluating the long term performance and safety of such systems demands an understanding of the coupled mechanical behavior and transport properties of salt this volume presents a collection of 60 research papers defining the state of the art in the field topics range from fundamental work on deformation mechanisms and damage of rock salt to compaction of engineered salt backfill the latest constitutive models are applied in computational studies addressing the evolution and integrity of storage caverns repositories salt mines and entire salt formations while field studies document ground truth at multiple scales the volume is structured into seven themes microphysical processes and creep models laboratory testing geological isolation systems and geotechnical barriers analytical and numerical modelling monitoring and site specific studies cavern and borehole abandonment and integrity energy storage in salt caverns the

mechanical behavior of salt x will appeal to graduate students academics engineers and professionals working in the fields of salt mechanics salt mining and geological storage of energy and wastes but also to researchers in rock physics in general

worldwide marine ecosystems have been lost and degraded due to anthropogenic disturbances for example oyster reefs have declined by at least 85 coral reefs by 19 seagrasses by 29 north american salt marshes by 42 and mangroves by 35 from the early 19th century deepwater reefs and deep sea vents are not immune and have also been reduced in extent in many areas factors driving these losses include habitat destruction pollution invasive species overfishing trawling mining and more recently climate change effects such as ocean warming species range changes and acidification these habitat declines are occurring at a time when marine waters are being used at or near their maximum productive capacity to meet the contemporary needs of an ever increasing human population because coastal and marine ecosystems generate some of the richest biodiversity hotspots on earth and provide critical ecosystem services including storm protection fisheries production and carbon storage over 1 billion us dollars have been spent globally in an attempt to halt and reverse observed declines early conservation efforts aimed at protecting these valuable and threatened habitats focused on reducing human impacts and physical stressors however with habitat degradation continuing and sometimes increasing in rate it is now clear conservation alone will not be sufficient to protect and reestablish coastal ecosystems habitat restoration although in existence for many decades has recently been elevated as a new primary strategy to stem and even reverse coastal habitat loss the call for increasing investment in restoration efforts has emerged with significant advances in propagule rearing and dispersion of habitat forming organisms e g oysters seagrasses corals in addition restoration resources are increasingly allocated by governments and or large corporations with the aim to for example fix past landscape engineering efforts that had unintended environmental consequences such investments are being made to i provide jobs for those unemployed during economic downturns ii restore ecosystems destroyed by natural disasters and stressors iii increase coastal defense in response to increased frequency of intense storms and or iv compensate for pollution and development driven habitat degradation conservation practitioners have traditionally been skeptical to invest heavily in restoration at large scales because of the high cost per area 10 000 5 000 000 us ha for coastal vs 500 5 000 us ha for terrestrial systems to replant coastal ecosystems and or the high chance that the restored ecosystems will not live long e g outplanted corals for restoration to be effective and employed as a primary method of coastal conservation at relevant scales we must improve its efficiency lower costs and rapidly share and incorporate advances one crucial step will be to identify when and where restoration attempts have been carried out according to state of art ecological theory and gauge their success

another is generating synthesis studies that focus both within and across ecosystems to identify efficiencies adaptations and innovations work that shows theoretical and methodological innovations in specific ecosystems as well as across systems will be critical to pushing all fields of mer forward although there is rapidly increasing interest and investment the field of marine ecosystem restoration is just beginning to undergo synthesis therefore the aim of this research topic is to bring together research contributions to help address this synthesis need provide a spotlight for recent innovations enhance our understanding of successful methods in marine ecosystem restoration and promote integration of ecological sociological and engineering theory into restoration practices
