this is the first volume in a trilogy on modern signal processing the three books provide a concise exposition of signal processing topics and a guide to support individual practical exploration based on matlab programs this book includes matlab codes to illustrate each of the main steps of the theory offering a self contained guide suitable for independent study the code is embedded in the text helping readers to put into practice the ideas and methods discussed the book is divided into three parts the first of which introduces readers to periodic and non periodic signals the second part is devoted to filtering which is an important and commonly used application the third part addresses more advanced topics including the analysis of real world non stationary signals and data e g structural fatigue earthquakes electro encephalograms birdsong etc the book s last chapter focuses on modulation an example of the intentional use of non stationary signals

the handbook of information security is a definitive 3 volume handbook that offers coverage of both established and cutting edge theories and developments on information and computer security the text contains 180 articles from over 200 leading experts providing the benchmark resource for information security network security information privacy and information warfare

all aspects pertaining to algorithm design and algorithm analysis have been discussed over

the chapters in this book design and analysis of algorithms resource description page

this comprehensive encyclopedia provides easy access to information on all aspects of cryptography and security the work is intended for students researchers and practitioners who need a quick and authoritative reference to areas like data protection network security operating systems security and more

our reliance on ever more sophisticated computer systems for the management of data and information means that the field of security and privacy technology continues to be of crucial importance to us all this book presents ten peer reviewed papers from the 2013 workshop radio frequency identification internet of things security rfidsec 13 asia held in guangzhou china in november 2013 this is the fifth of a series of workshops organized by the asian branch of rfidsec which provides a platform for researchers enterprises and governments to investigate discuss and propose new solutions for the security and privacy issues related to rfid iot technologies and applications topics covered include rfid authentication mutual authentication and ownership transfer security of rfid applications nfc and the internet of things as well as side channel attacks the book will be of interest to all those whose work involves the security aspects of information management

with up to date coverage of modern architectural approaches this handbook provides a thorough discussion of the fundamentals of computer organization and architecture as well as the critical role of performance in driving computer design captures the field s continued innovations and improvements with input from active practitioners reviews the two most prevalent approaches superscalar which has come to dominate the microprocessor design field including the widely used pentium and epic seen in the ia 64 architecture of intel s itanium views systems from both the architectural and organizational perspectives includes coverage of critical topics such as bus organization computer arithmetic i o modules risc memory and parallel processors for professionals in computer product marketing or information system configuration and maintenance

contains articles on programming languages and their semantics programming systems storage allocations and garbage collection languages and methods for writing specifications testing and verification methods and algorithms specifically related to the implementation of language processors

the basin of attraction of an equilibrium of an ordinary differential equation can be determined using a lyapunov function a new method to construct such a lyapunov function using radial basis functions is presented in this volume intended for researchers and advanced students from both dynamical systems and radial basis functions besides an introduction to both areas and a detailed description of the method it contains error estimates and many examples

lévy processes i e processes in continuous time with stationary and independent increments are named after paul lévy who made the connection with infinitely divisible distributions and described their structure they form a flexible class of models which have been applied to the study of storage processes insurance risk queues turbulence laser cooling and of course finance where the feature that they include examples having heavy tails is particularly important their sample path behaviour poses a variety of difficult and fascinating problems

such problems and also some related distributional problems are addressed in detail in these notes that reflect the content of the course given by r doney in st flour in 2005

the present volume is self contained and introduces to the treatment of linear and nonlinear quasi linear abstract evolution equations by methods from the theory of strongly continuous semigroups the theoretical part is accessible to graduate students with basic knowledge in functional analysis only some examples require more specialized knowledge from the spectral theory of linear self adjoint operators in hilbert spaces particular stress is on equations of the hyperbolic type since considerably less often treated in the literature also evolution equations from fundamental physics need to be compatible with the theory of special relativity and therefore are of hyperbolic type throughout detailed applications are given to hyperbolic partial differential equations occurring in problems of current theoretical physics in particular to hermitian hyperbolic systems this volume is thus also of interest to readers from theoretical physics

the modern theory and practice of dynamical systems requires the study of structures that fall outside the scope of traditional subjects of mathematical analysis an important tool to investigate such complicated phenomena as chaos and strange attractors is the method of symbolic dynamics this book describes a family of the algorithms to study global structure of systems by a finite covering of the phase space we construct a directed graph symbolic image with vertices corresponding to cells of the covering and edges corresponding to admissible transitions the method is used to localize the periodic orbits and the chain recurrent set to construct the attractors and their basins to estimate the entropy lyapunov exponents and the morse spectrum to verify the hyperbolicity and the structural stability considerable information can be obtained thus and more techniques may be discovered in future research
