the conversion of lignocellulosic biomass into renewable fuels and other commodities has provided an appealing alternative towards  
 supplanting global dependence on fossil fuels the suitability of multitudes of plants for deconstruction to useful precursor molecules and  
 products is currently being evaluated these studies have probed a variety of phenotypic traits including cellulose non cellulosic  
 polysaccharide lignin and lignin monomer composition glucose and xylose production following enzymatic hydrolysis and an assessment

of lignin carbohydrate and lignin lignin linkages to name a few these quintessential traits can provide an assessment of biomass recalcitrance enabling researchers to devise appropriate deconstruction strategies plants with high polysaccharide and lower lignin contents have been shown to breakdown to monomeric sugars more readily not all plants contain ideal proportions of the various cell wall constituents however the capabilities of biotechnology can alleviate this conundrum by tailoring the chemical composition of plants to be more favorable for conversion to sugars fuels etc increases in the total biomass yield cellulose content or conversion efficiency through for example a reduction in lignin content are pathways being evaluated to genetically improve plants for use in manufacturing biofuels and bio based chemicals although plants have been previously domesticated for food and fiber production the collection of phenotypic traits prerequisite for biofuel production may necessitate new genetic breeding schemes given the plethora of potential plants available for exploration rapid analytical methods are needed to more efficiently screen through the bulk of samples to hone in on which feedstocks contain the desired chemistry for subsequent conversion to valuable renewable commodities the standard methods for analyzing biomass and related intermediates and finished products are laborious potentially toxic and or destructive they may also necessitate a complex data analysis significantly increasing the experimental time and add unwanted delays in process monitoring where delays can incur in significant costs advances in thermochemical and spectroscopic techniques have enabled the screening of thousands of plants for different phenotypes such as cell wall cellulose non cellulosic polysaccharide and lignin composition lignin monomer composition or monomeric sugar release some instrumental methods have been coupled with multivariate analysis providing elegant chemometric predictive models enabling the accelerated identification of potential feedstocks in addition to the use of high throughput analytical methods for the

characterization of feedstocks based on phenotypic metrics rapid instrumental techniques have been developed for the real time monitoring of diverse processes such as the efficacy of a specific pretreatment strategy or the formation of end products such as biofuels and biomaterials real time process monitoring techniques are needed for all stages of the feedstocks to biofuels conversion process in order to maximize efficiency and lower costs by monitoring and optimizing performance these approaches allow researchers to adjust experimental conditions during rather than at the conclusion of a process thereby decreasing overhead expenses this frontiers research topic explores options for the modification of biomass composition and the conversion of these feedstocks into to biofuels or biomaterials and the related innovations in methods for the analysis of the composition of plant biomass and advances in assessing up and downstream processes in real time finally a review of the computational models available for techno economic modeling and lifecycle analysis will be presented

cancer is one of the leading death cause of human population increasingly seen in recent times plants have been used for medicinal purposes since immemorial times though several synthetic medicines are useful in treating cancer they are inefficient and unsafe however plants have proved to be useful in cancer cure moreover natural compounds from plants and their derivatives are safe and effective in treatment and management of several cancer types the anticancer plants such as catharanthus roseus podophyllum peltatum taxus brevifolia camptotheca acuminata andrographis paniculata crateva nurvala croton tonkinensis oplopanax horridus etc are important source of chemotherapeutic compounds these plants have proven their significance in the treatment of cancer and various other infectious diseases nowadays several well known anticancer compounds such as taxol podophyllotoxins camptothecin vinblastine vincristine homoharringtonine etc have been isolated and purified from these medicinal plants many of them are used effectively to combat cancer

and other related diseases the herbal medicine and their products are the most suitable and safe to be used as an alternative medicine based on their traditional uses and experimental evidences the anticancer products or compounds are isolated or extracted from the medicinally important plants many of these anticancer plants have become endangered due to ruthless harvesting in nature hence there is a need to conserve these species and to propagate them in large scale using plant tissue culture alternatively plant cell tissue and organ culture biotechnology can be adopted to produce these anticancer compounds without cultivation the proper knowledge and exploration of these isolated molecules or products could provide an alternative source to reduce cancer risk anti tumorigenic properties and suppression of carcinogen activities anticancer plants volume 1 properties and application is a very timely effort in this direction discussing the various types of anticancer plants as a source of curative agent their pharmacological and nutraceutical properties cryo preservations and recent trends to understand the basic cause and consequences involved in the diseases diagnosis we acknowledge the publisher springer for their continuous inspiration and valuable suggestions to improvise the content of this book we further extend our heartfelt gratitude to all our book contributors for their support and assistance to complete this assignment i am sure that these books will benefit the scientific communities including academics pharmaceuticals nutraceuticals and medical practitioners
