aerodynamics is a branch of fluid mechanics that deals with the motion of air and other gaseous fluids and the forces acting on bodies in motion relative to such fluids aerodynamics are classified according to mach number into incompressible subsonic compressible subsonic transonic supersonic and hypersonic aerodynamics aerodynamics can be divided into different forms of internal or external aerodynamics for example the study of flow properties inside a gas turbine or rocket engine is an example of internal aerodynamics that is important in accurately estimating thrust force examples of external aerodynamics include the flow around the body of airplanes helicopters space capsules cars rockets and missiles trains ships wind turbines and even such structures as bridges and tall buildings which often have to withstand strong winds since the first human flights until today aerodynamics has been growing and developing rapidly aerodynamics is one of the applied sciences in engineering that pursues several goals such as estimating forces moments on objects moving in the air or estimating heat transfer from these objects aerodynamics investigates how gases interact with moving bodies the main purpose of aerodynamics in most cases is to reduce drag forces and increase lift force which can lead to less fuel consumption in vehicles and achieving the greatest speed of course in some special cases such as hypersonic aerodynamics there is a greater interest in increasing drag to reduce the adverse effects of aerodynamic heating another goal of studying aerodynamics is to obtain the details of the flow around flying objects for example the

correct operation of a control rudder or flap in a supersonic aircraft or the recognition of the phenomenon of blackout during spacecraft reentry which occurs under the influence of aerothermodynamic heating and plasma formed around the antenna is of great importance

the encyclopaedia of mathematics is the most up to date authoritative and comprehensive english language work of reference in mathematics which exists today with over 7 000 articles from a integral to zygmond class of functions supplemented with a wealth of complementary information and an index volume providing thorough cross referencing of entries of related interest the encyclopaedia of mathematics offers an immediate source of reference to mathematical definitions concepts explanations surveys examples terminology and methods the depth and breadth of content and the straightforward careful presentation of the information with the emphasis on accessibility makes the encyclopaedia of mathematics an immensely useful tool for all mathematicians and other scientists who use or are confronted by mathematics in their work the encyclopaedia of mathematics provides without doubt a reference source of mathematical knowledge which is unsurpassed in value and usefulness it can be highly recommended for use in libraries of universities research institutes colleges and even schools

this textbook is for use in an intermediate to advanced aerodynamics course topics include fluid properties and mechanics incompressible flow fields and boundary layers compressible subsonic and transonic flows hypersonic flows and supersonic flows over wings and airplane configurations update

the prerequisite for the study of this book is a knowledge of matrices and the essentials of functions of a complex variable it has been developed from courses given by the authors and probably contains more material than will ordinarily be covered in a one year course it is hoped that the book will be a useful text in the application of differential equations as well as for the pure mathematician
