interest in acoustics continues to increase although this branch of science was concerned primarily with the promotion of qualitative and quantitative sound transmission until a few decades ago emphasis is currently placed also on the limitation of sound nuisance and by extension the setting of boundaries for permissible sound levels in places where people are found this last aspect in particular is exercising more and more influence on the design of buildings and machines and in town and country planning in addition sound vibrations because of their physical characteristics are being used increasingly in disparate disciplines such as navigation medical investigation and non destructive materials research the flood of publications resulting from this increased interest in acoustics has led to a growing number of people being confronted with terminology which had until quite recently only been used by a relatively small group of specialists and had remained largely unknown as a result this four language dictionary based on w reichardt technische akustik berlin 1979 has been compiled to make not only this literature but also the nomenclature of equipment and instructions for their use accessible to the specialist and the interested layman

human behavior and decision making is subject to social and motivational influences such as emotions norms and self other regarding preferences the identification of the neural and psychological mechanisms underlying these factors is a central issue in psychology behavioral economics and social neuroscience with important clinical social and even political implications however despite a continuously growing interest from the scientific community the processes underlying these factors as well as their ontogenetic and phylogenetic development have so far remained elusive in this research topic we collect articles that provide challenging insights and stimulate a fruitful controversy on the question of what determines social behavior indeed

over the last decades research has shown that introducing a social context to otherwise abstract tasks has diverse effects on social behavior on the one hand it may induce individuals to act irrationally for instance to refuse money but on the other hand it improves individuals reasoning in that formerly difficult abstract problems can be easily solved these lines of research led to distinct although not necessarily mutually exclusive models for socially driven behavioral changes for instance a popular theoretical framework interprets human behavior as a result of a conflict between cognition and emotion with the cognitive system promoting self interested choices and the emotional system triggered by the social context operating against them other theories favor social norms and deontic heuristics in biasing human reasoning and encouraging choices that are sometimes in conflict with one's interest few studies attempted to disentangle between these as well as other models as a consequence although insightful results arise from specific domains tasks a comprehensive theoretical framework is still missing furthermore studies employing neuroimaging techniques have begun to shed some light on the neural substrates involved in social behavior implicating consistently although not exclusively portions of the limbic system the insular and the prefrontal cortex in this context a challenge for present research lies not only in further mapping the brain structures implicated in social behavior or in describing in detail the functional interaction between these structures but in showing how the implicated networks relate to different theoretical models this is research topic hosted by members of the swiss national center of competence in research affective sciences emotions in individual behaviour and social processes we collected contributions from the international community which extended the current knowledge about the psychological and neural structures underlying social behavior and decision making in particular we encouraged submissions from investigators arising from different domains psychology behavioral economics affective sciences etc implementing different techniques behavior electrophysiology neuroimaging brain stimulations on different populations neurotypical adults children brain damaged or psychiatric patients etc animal studies are also included as the data reported are of high comparative value finally we also welcomed submissions of meta analytical articles mini reviews and perspective papers which offer provocative and insightful interpretations of the recent literature in the field
