1. Solution: $a = \frac{v - u}{t} = \frac{30 - 10}{5} = 4 \text{ m/s}^2$

2. Problem: A cyclist accelerates from 5 m/s to 15 m/s over 10 seconds. What is the acceleration?

3. Solution: $a = \frac{15 - 5}{10} = 1 \text{ m/s}^2$

Numerical Set 3: Equations of Motion

Problem: An object starts from rest and accelerates uniformly at 2 m/s^2 . Find the velocity after 8 seconds.

1. Solution: Using $v = u + at$, where $u = 0$: $v = 0 + 2 \times 8 = 16 \text{ m/s}$

2. Problem: A car accelerates at 3 m/s^2 over a distance of 180 meters. If its initial velocity is 0, find its final velocity.

Read the problem carefully, identify knowns and unknowns, select the appropriate formula, perform calculations systematically, and verify your answers. 3. Are there any shortcuts for solving motion numericals? While understanding concepts is essential, shortcuts like unit conversions, Question Answer A car accelerates uniformly from a speed of 20 m/s to 40 m/s over a distance of 200 meters. Find the acceleration. Using the equation $v^2 = u^2 + 2as$, we get $a = (v^2 - u^2) / (2s) = (40^2 - 20^2) / (2 \times 200) = (1600 - 400) / 400 = 1200 / 400 = 3 \text{ m/s}^2$. A cyclist travels a distance of 150 km in 5 hours. What is the average speed? Average speed = total distance / total time = 150 km / 5 hr = 30 km/hr. An object moves with a constant velocity of 15 m/s. How far does it travel in 10 seconds? Distance = velocity \times time = 15 m/s \times 10 s = 150 meters. A train starting from rest accelerates uniformly at 0.5 m/s². Find the velocity after 20 seconds. Using $v = u + at$, where $u = 0$, $v = 0 + 0.5 \times 20 = 10 \text{ m/s}$. A particle moves along a straight line with an initial velocity of 5 m/s and accelerates at 2 m/s². What is its velocity after 8 seconds? $v = u + at = 5 + 2 \times 8 = 5 + 16 = 21 \text{ m/s}$. A stone is dropped from a height of 80 meters. Calculate the time it takes to reach the ground (ignore air resistance). Using $s = ut + \frac{1}{2}gt^2$, with $u=0$, $s=80$, $g=9.8 \text{ m/s}^2$, $t = \sqrt{2s/g} = \sqrt{2 \times 80 / 9.8} \approx \sqrt{16.33} \approx 4.04 \text{ seconds}$. A swimmer crosses a river flowing at 3 m/s with a downstream velocity of 4 m/s. What is the speed of the swimmer relative to the bank? Using vector addition, total speed = $\sqrt{4^2 + 3^2} = \sqrt{16 + 9} = \sqrt{25} = 5 \text{ m/s}$. An object travels 100 meters in 20 seconds with uniform speed. What is its velocity? Velocity = distance / time = 100 m / 20 s = 5 m/s. A ball is thrown vertically upward with an initial speed of 20 m/s. How high does it go? Using $v^2 = u^2 - 2gh$, at the highest point $v=0$, so $h = u^2 / (2g) = (20)^2 / (2 \times 9.8) \approx 400 / 19.6 \approx 20.41 \text{ meters}$. A vehicle covers 60 km in 1 hour and then 80 km in 2 hours. What is the average speed for the entire journey? Total distance = 60 + 80 = 140 km, total time = 1 + 2 = 3 hours, average speed = 140 km / 3 hr $\approx 46.67 \text{ km/hr}$. Class IX Physics Motion Numericals For Practice 5 Class IX Physics Motion Numericals for Practice: A Comprehensive Guide for Students Understanding the concepts of motion is fundamental in physics, especially at the class IX level, where foundational principles are introduced and explored through various numerical problems. Class IX physics

motion numericals for practice serve as an essential tool for students aiming to solidify their grasp of topics such as distance, displacement, velocity, acceleration, and the equations of motion. This article provides a detailed, reader-friendly exploration of these numericals, offering step-by-step solutions and strategies to approach typical problems encountered in exams and assignments.

--- The Importance of Practice in Class IX Physics Motion Before diving into specific numericals, it's important to recognize the role of practice in mastering physics. Numerical problems reinforce theoretical concepts, enhance problem-solving skills, and prepare students for higher-level physics topics. They also promote analytical thinking, as students learn to interpret given data, choose appropriate formulas, and execute calculations accurately.

--- Core Concepts in Motion Relevant to Numericals To effectively solve motion problems, students should understand the foundational concepts:

- Distance and Displacement: Total path traveled vs. shortest straight-line distance from start to end.
- Speed and Velocity: Speed is scalar, velocity is vector; velocity includes direction.
- Acceleration: Rate of change of velocity.
- Equations of Motion: Relationships among displacement, initial velocity, final velocity, acceleration, and time. An understanding of these concepts provides the basis for tackling numerical problems with confidence.

--- Types of Numerical Problems in Class IX Physics Motion Numerical problems generally fall into categories based on the parameters involved:

1. Calculating speed, velocity, and acceleration
2. Using equations of motion to find unknown quantities
3. Analyzing uniform and non-uniform motion
4. Converting units and interpreting data

Let's explore these with illustrative examples and solutions.

--- Numerical Problems and Solutions in Motion

1. Calculating Speed, Velocity, and Acceleration

Problem 1: A car covers a distance of 150 km in 3 hours. Find its average speed. If the car takes a sharp turn at halfway, and the total displacement from start to end is 100 km, determine the average velocity.

Solution:

- Average speed:
$$\text{Speed} = \frac{\text{Total Distance}}{\text{Time}} = \frac{150 \text{ km}}{3 \text{ hrs}} = 50 \text{ km/hr}$$
- Average velocity: Since displacement is 100 km in a certain direction, and time is 3 hours,
$$\text{Velocity} = \frac{\text{Displacement}}{\text{Time}} = \frac{100 \text{ km}}{3 \text{ hrs}} \approx 33.33 \text{ km/hr}$$

Note: The change in path (due to turning) affects displacement but not average speed.

--- 2. Using Equations of Motion

Problem 2: A train accelerates uniformly from a velocity of 20 m/s to 30 m/s over a distance of 500 meters. Find its acceleration.

Solution: Using the second equation of motion:
$$v^2 = u^2 + 2as$$
 where:

- $v = 30 \text{ m/s}$ (final velocity)
- $u = 20 \text{ m/s}$ (initial velocity)
- $s = 500 \text{ m}$ (distance)

Rearranged:
$$a = \frac{v^2 - u^2}{2s} = \frac{(30)^2 - (20)^2}{2 \times 500} = \frac{900 - 400}{1000} = \frac{500}{1000} = 0.5 \text{ m/s}^2$$

Answer: The train accelerates at 0.5 m/s^2 .

--- 3. Analyzing Uniform and Non-Uniform Motion

Problem 3: A cyclist moves with uniform speed of 15 km/h for 2 hours, then accelerates uniformly at 2 km/h^2 for the next hour. Find the total distance covered.

Solution:

- First part:
$$\text{Distance}_1 = \text{Speed} \times \text{Time} = 15 \text{ km/h} \times 2 \text{ h} = 30 \text{ km}$$
- Second part: Initial speed, $u = 15 \text{ km/h}$ Acceleration, $a = 2 \text{ km/h}^2$ Time, $t = 1 \text{ hr}$ Final velocity after 1 hour:
$$v = u + at = 15 + 2 \times 1 = 17 \text{ km/h}$$
 Distance covered during acceleration:
$$s = ut + \frac{1}{2}at^2 = 15 \times 1 + \frac{1}{2} \times 2 \times 1^2 = 15 + 1 = 16 \text{ km}$$
- Total distance:
$$30 \text{ km} + 16 \text{ km} = 46 \text{ km}$$

--- Strategies for Solving Motion Numericals

- Read the problem carefully: Identify knowns and unknowns.
- Choose the right formula: Based on what parameters are given.
- Convert units if necessary: Ensure consistency.
- Use step-by-step calculations: Avoid mistakes

by breaking down the problem. - Check units and reasonableness: Does the answer make sense? --- Practice Problems for Reinforcement To enhance understanding, students should attempt the following practice problems: 1. A ball is dropped from a height of 80 meters. How long does it take to reach the ground? (Assume acceleration due to gravity, $(g = 9.8, \text{m/s}^2)$) 2. An object moves with a constant velocity of 25 m/s for 10 seconds. What is the total displacement? 3. A vehicle accelerates uniformly from 0 to 60 km/h in 10 seconds. Find its acceleration in m/s^2 . 4. A runner covers 400 meters in 50 seconds. What is his average speed? If his average velocity is zero, what does that imply about his motion? --- Summary and Final Tips - Consistent practice with numerical problems enhances conceptual clarity. - Always write down knowns, unknowns, and formulas before solving. - Use diagrams wherever possible to visualize the problem. - Keep units consistent; convert when necessary. - Verify your answers by checking if they are reasonable. --- Conclusion Mastering class IX physics motion numericals for practice is crucial for building a strong foundation in physics.
