abstract this paper introduces a new framework for constructing learning algorithms our methods involve master algorithms which use learning algorithms for intersection closed concept classes as subroutines for example we give a master algorithm capable of learning any concept class whose members can be expressed as nested differences e g $c_{\text{subscript } 1} c_{\text{subscript } 2} c_{\text{subscript } 3} c_{\text{subscript } 4} c_{\text{subscript } 5}$ of concepts from an intersection closed class we show that our algorithms are optimal or nearly optimal with respect to several different criteria these criteria include the number of examples needed to produce a good hypothesis with high confidence the worst case total number of mistake made and the expected number of mistakes made in the first t trials
