excerpt from oil storage tanks and reservoirs with a brief discussion of losses of oil in storage and methods of prevention the bureau of mines has been conducting investigations with the view of determining the types of containers best adapted to the storage of oil these investigations have shown that tanks composed wholly of steel give the best results where larger containers than it is feasible to build with steel are desired concrete lined reservoirs can be recommended for some grades of oil practically all such containers in use at present have wooden roofs and this type of construction is here described although it is the belief of the writer that concrete roofs would be far more satisfactory in every way and that the difference in cost between a concrete and a wooden roof would as a rule in a few years time be offset by a saving of oil and in cost of repairs and renewals about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

in 2000 there were 6215 substantiated pollution incidents involving oil a 15 per cent increase on the number of incidents in 1999 environment agency data indicate that that a large number of these could have been prevented if the oil had been stored in adequately bunded tank systems this report provides detailed guidance on the design construction and use of proprietary prefabricated above ground bunded oil storage tank systems for use in domestic agricultural and industrial applications oil storage tank systems of steel or plastic construction up to 140 000 litres are reviewed and the use of mobile oil storage bowsters is also included this report assesses the level of environmental protection offered by these types of systems against common causes of oil pollution and the preventative measures that can be taken to avoid them it offers good practice recommendations which are designed to minimise the risk of oil pollution

the scale of global transportation of oil cargoes has led to a demand for increased control and international legislation to combat accidental and operational discharges of oily wastes and residues at sea since 1954 the international maritime organisation imo has provided the international forum for the development of several proposals for controlling oil pollution from shipping which culminated in the 1973 international convention for prevention of pollution from ships and the 1978 protocol relating to this convention together known as marpol 73/78 apart from the requirement for improvements in the constructional design of tankers and operational procedures to enhance both safety and pollution control in the carriage of oil and other noxious substances at sea marpol 73/78 called for the extensive installation of oil discharge monitoring control and separating equipment on board ships and offshore platforms the 1973 convention came into force in october 1983 twelve months after sufficient countries had ratified it and agreed to abide by the international rules and regulations as a result a large number of systems have now been installed and are operational the demand to separate oil from water to give an oil

content of less than 15 parts per million ppm and measure this on line in an extremely difficult environment has provided a considerable impetus for the development of novel and robust instrumentation and systems
