in the preface to early papers on diffraction of x rays by crystals volume i containing chapters i v and published in 1969 the history and planning of the complete book were outlined the publication in two separate and consecutive volumes was merely a matter of management the compilation of both volumes was done at the same time there is a distinct difference in subject matter between both volumes volume i contains the

fundamentals of the theory while volume ii treats the practical development of the trial method and the genesis and first applications of the fourier method in the period covered by early papers 1912 1935 the trial method leads to the successful conquest of structures with up to a hundred parameters we conclude the book with patterson s discovery 1934 of the p2 series as described in his second more detailed and extended paper of 1935 with this method the apparatus was completed which led to the present undreamt of successes of the fourier method in the field of organic chemistry we have considered the inclusion of robertson s famous synthesis of the structure of phtalocyanine 1936 however we decided that its proper place would be at the beginning of a book which no doubt will appear one day describing this later period considerations of space caused us to give up the chapter on texture planned at first

this book is written for the research biochemist who needs to know more about the particular field of dioxygen metabolism whether this be for designing lectures for a graduate level course or for his or her own research needs we hope researchers in a given area of dioxygen metabolism will gain knowledge of related fields of dioxygen metabolism we have decided to use the term dioxygen to distinguish molecular oxygen from divalent oxygen in water and organic compounds dioxygen being a simpler term than molecular oxygen we do not intend to review the metabolism of all compounds that contain oxygen since this would include all of biochemistry an understanding of dioxygen chemistry is essential to the discussion of the biochemistry of dioxygen while this statement could be made about any biochemical constituent the chemistry of dioxygen is so unusual that interpretations without detailed chemical background are futile prediction of dioxygen reaction products by analogy with other oxidants is impossible the partial reduction products of dioxygen superoxide ion and peroxides develop naturally in the chemistry of dioxygen it would be difficult to discuss dioxygen biochemistry without first discussing these partial reduction products

free radicals play key roles in physiologic regulation and in many degenerative and pathologic processes making them a fertile area of research this book focuses on spin trapping a sophisticated technique for the identification of free radicals in biological systems the method is complex and this book offers an in depth guide to all of the critical aspects needed for its application to free radicals in biology this includes advice on interpreting results trouble shooting and experimental designs
