the aim of this book is to handle different application problems of science and engineering using expert artificial neural network ann as such the book starts with basics of ann along with different mathematical preliminaries with respect to algebraic equations then it addresses ann based methods for solving different algebraic equations viz polynomial equations diophantine equations transcendental equations system of linear and nonlinear equations eigenvalue problems etc which are the basic equations to handle the application problems mentioned in the content of the book although there exist various methods to handle these problems but sometimes those may be problem dependent and may fail to give a converge solution with particular discretization accordingly ann based methods have been addressed here to solve these problems detail ann architecture with step by step procedure and algorithm have been included different example problems are solved with respect to various application and mathematical problems convergence plots and or convergence tables of the solutions are depicted to show the efficacy of these methods it is worth mentioning that various application problems viz bakery problem power electronics applications pole placement electrical network analysis structural engineering problem etc have been solved using the ann based methods

how we reason with mathematical ideas continues to be a fascinating and challenging topic of research particularly with the rapid and diverse developments in the field of cognitive science that have taken place in recent years because it draws on multiple disciplines including psychology philosophy computer science linguistics and anthropology cognitive science provides rich scope for addressing issues that are at the core of mathematical learning drawing upon the interdisciplinary nature of cognitive science this book presents a broadened perspective on mathematics and mathematical reasoning it represents a move away from the traditional notion of reasoning as abstract and disembodied to the contemporary view that it is embodied and imaginative from this perspective mathematical reasoning

involves reasoning with structures that emerge from our bodily experiences as we interact with the environment these structures extend beyond finitary propositional representations mathematical reasoning is imaginative in the sense that it utilizes a number of powerful illuminating devices that structure these concrete experiences and transform them into models for abstract thought these thinking tools analogy metaphor metonymy and imagery play an important role in mathematical reasoning as the chapters in this book demonstrate yet their potential for enhancing learning in the domain has received little recognition this book is an attempt to fill this void drawing upon backgrounds in mathematics education educational psychology philosophy linguistics and cognitive science the chapter authors provide a rich and comprehensive analysis of mathematical reasoning new and exciting perspectives are presented on the nature of mathematics e g mind based mathematics on the array of powerful cognitive tools for reasoning e g analogy and metaphor and on the different ways these tools can facilitate mathematical reasoning examples are drawn from the reasoning of the preschool child to that of the adult learner

research in string theory has generated a rich interaction with algebraic geometry with exciting new work that includes the Strominger-Yau-Zaslow conjecture this monograph builds on lectures at the 2002 Clay School on Geometry and String Theory that sought to bridge the gap between the languages of string theory and algebraic geometry presenting an updated discussion that includes subsequent developments the group of distinguished mathematicians and mathematical physicists who produced this monograph worked as a team to create a unique volume its overall goal is to explore the physical and mathematical aspects of Dirichlet branes the narrative is organized around two principal ideas Kontsevich's homological mirror symmetry conjecture and the Strominger-Yau-Zaslow

conjecture the authors explain how kontsevich's conjecture is equivalent to the identification of two different categories of dirichlet branes they also explore the ramifications and current state of the strominger yau zaslow conjecture they relate the ideas to active areas of research that include the mckay correspondence topological quantum field theory and stability structures the authors were not satisfied to tell their story twice from separate mathematics and physics points of view instead theirs is a unified presentation offered in a way that both mathematicians and physicists can follow without having all of the foundations of both subjects at their immediate disposal
