evolutionary psychology and behavioural genetics are two successful and important fields in the study of human behaviour but practitioners in these subjects have different conceptions of the nature of human intelligence evolutionary psychologists dispute the existence of general intelligence and emphasise the differences among species they argue that natural and sexual selection would be expected to produce intelligences that are specialised for particular domains as encountered by particular species behavioural geneticists consider general intelligence to be the most fundamental aspect of intelligence and concentrate on the differences between individuals of the same species this exciting book features papers and discussion contributions from leading behavioural geneticists evolutionary psychologists and experts on intelligence that explore the differences and the tensions between these two approaches the nature of g or general intelligence is discussed in detail as is the issue of the heritability of intelligence the alternative approaches that emphasise domain specific intelligences are explored alongside wide ranging discussions on a broad range of issues such as the biological basis for intelligence animal models and changes in iq scores over time

numerous functions cognitive skills and behaviors are associated with intelligence yet decades of research has yielded little consensus on its definition emerging from often conflicting studies is the provocative idea that intelligence evolved as an

what is meant by the term intelligence and once defined how do we go about achieving a valid measurement of this faculty this classic textbook originally published in 1979 and now reissued with a new preface by sybil eysenck incorporates a broad range of findings and reanalyzes much of the existing literature in this area in the structure and measurement of intelligence hans eysenck draws on methods for determining the effect of genetics and environment on the development of intelligence and examines the validity of the term as defined in relation to internal as well as external criteria he tests a number of hypotheses on intelligence against empirical research findings and considers various criticisms in detail the significance of intelligence and its measurement in society are explored in depth eysenck greatly expands upon such questions as does iq measure intelligence how valid is the nature versus nurture argument and how might socioeconomic status influence one's intelligence designed primarily for students and scholars in psychology and education this text will make thought provoking reading for all concerned with the development and measurement of intelligence in the individual

what is intelligence may seem like a simple question to answer but the study and measurement of human intelligence is one of the most controversial subjects in psychology for much of its history the focus has been on differences between people on what it means for one person to be more intelligent than another and how such differences might have arisen obscuring efforts to understand the general nature of intelligence these are obviously fundamental questions still widely debated and

misunderstood new definitions of intelligence and new factors affecting intelligence are frequently being described while psychometric testing is applied in most large industries iq and human intelligence provides a clear authoritative overview of the main issues surrounding this fascinating area including the modern development of iq tests the heritability of intelligence theories of intelligence environmental effects on iq factor analysis relationship of cognitive psychology to measuring iq and intelligence in the social context the clear accessible style and numerous explanatory boxes make this the ideal text for advanced undergraduate and graduate students in psychology

the field of value alignment or more broadly machine ethics is becoming increasingly important as artificial intelligence developments accelerate by alignment we mean giving a generally intelligent software system the capability to act in ways that are beneficial or at least minimally harmful to humans there are a large number of techniques that are being experimented with but this work often fails to specify what values exactly we should be aligning when making a decision an agent is supposed to maximize the expected utility of its value function classically this has been referred to as happiness but this is just one of many things that people value in order to resolve this issue we need to determine a set of human values that represent humanity's interests although this problem might seem intractable research shows that people of various cultures and religions actually share more in common than they realize in this book we review world religions moral philosophy and evolutionary psychology to elucidate a common set of shared values we then show how these values can be used to address the alignment problem and conclude with problems and goals for future research the key audience for this book will be researchers in the field of ethics and artificial intelligence who are interested in or working on this problem these people will come from various professions and include philosophers computer programmers and psychologists as the problem itself is multi disciplinary

components of today's notions of intelligence chapters include coverage of intelligence and schooling cultural differences in views of intelligence the history of iq testing and its emergence into public consciousness iq as predictor of educational and occupational outcomes psychometrics and measurement of intelligence the future of intelligence research written by richard b fletcher and john hattie the author of the highly regarded visible learning this textbook will be invaluable for all undergraduate and masters level students studying the theory of intelligence and the impact of testing on educational detailed and annotated further reading lists and a glossary of terms are also included

the concept and measurement of intelligence present a curious paradox on the one hand scientists fluent in the complex statistics of intelligence testing theories devote their lives to exploration of cognitive abilities on the other hand the media and inexpert cross disciplinary scientists decry the effort as socially divisive and useless in practice in the past decade our understanding of testing has radically changed better selected samples have extended evidence on the role of heredity and environment in intelligence there is new evidence on biology and behavior advances in molecular genetics have enabled us to discover dma markers which can identify and isolate a gene for simple genetic traits paving the way for the study of multiple gene traits such as intelligence hans eysenck believes these recent developments approximate a general paradigm which could form the basis for future research he explores the many special abilities verbal numerical visuo spatial memory that contribute to our cognitive behavior he examines pathbreaking work on multiple intelligence and the notion of social or practical intelligence and considers whether these new ideas have any scientific meaning eysenck also includes a study of creativity and intuition as well as the production of works of art and science identifying special factors that interact with general intelligence to produce predictable effects in the actual world the work that hans eysenck has put together over the last fifty years in research into individual differences constitutes most of what anyone means by the structure and biological basis of personality and intelligence a giant in the field of psychology eysenck almost single handedly restructured and reordered his profession intelligence is eysenck s final book and the third in a series of his works from transaction
