a reissue of professor coxeter s classic text on non euclidean geometry

this is the definitive presentation of the history development and philosophical significance of non euclidean geometry as well as of the rigorous foundations for it and for elementary euclidean geometry essentially according to hilbert appropriate for liberal arts students prospective high school teachers math majors and even bright high school students the first eight chapters are mostly accessible to any educated reader the last two chapters and the two appendices contain more advanced material such as the classification of motions hyperbolic trigonometry hyperbolic constructions classification of hilbert planes and an introduction to riemannian geometry

this book gives a rigorous treatment of the fundamentals of plane geometry euclidean spherical elliptical and hyperbolic

this book develops a self contained treatment of classical euclidean geometry through both axiomatic and analytic methods concise and well organized it prompts readers to prove a theorem yet provides them with a framework for doing so chapter topics cover neutral geometry euclidean plane geometry geometric transformations euclidean 3 space euclidean n space perimeter area and volume spherical geometry hyperbolic geometry models for plane geometries and the hyperbolic metric

examines various attempts to prove euclid s parallel postulate by the greeks arabs and renaissance mathematicians it considers forerunners and founders such as saccheri lambert legendre w bolyai gauss others includes 181 diagrams

the distinctive approach of henderson and taimina s volume stimulates readers to develop a broader deeper understanding of mathematics through active experience including discovery discussion writing fundamental ideas

and learning about the history of those ideas a series of interesting challenging problems encourage readers to gather and discuss their reasonings and understanding the volume provides an understanding of the possible shapes of the physical universe the authors provide extensive information on historical strands of geometry straightness on cylinders and cones and hyperbolic planes triangles and congruencies area and holonomy parallel transport sss ass saa and aaa parallel postulates isometries and patterns dissection theory square roots pythagoras and similar triangles projections of a sphere onto a plane inversions in circles projections models of hyperbolic planes trigonometry and duality 3 spheres and hyperbolic 3 spaces and polyhedra for mathematics educators and other who need to understand the meaning of geometry

the russian edition of this book appeared in 1976 on the hundred and fiftieth anniversary of the historic day of february 23 1826 when lobachevskii delivered his famous lecture on his discovery of non euclidean geometry the importance of the discovery of non euclidean geometry goes far beyond the limits of geometry itself it is safe to say that it was a turning point in the history of all mathematics the scientific revolution of the seventeenth century marked the transition from mathematics of constant magnitudes to mathematics of variable magnitudes during the seventies of the last century there occurred another scientific revolution by that time mathematicians had become familiar with the ideas of non euclidean geometry and the algebraic ideas of group and field all of which appeared at about the same time and the later ideas of set theory this gave rise to many geometries in addition to the euclidean geometry previously regarded as the only conceivable possibility to the arithmetics and algebras of many groups and fields in addition to the arithmetic and algebra of real and complex numbers and finally to new mathematical systems i e sets furnished with various structures having no classical analogues thus in the 1870 s there began a new mathematical era usually called until the middle of the twentieth century the era of modern mathematics

one of the first college level texts for elementary courses in non euclidean geometry this volume is geared toward students familiar with calculus topics include the fifth postulate hyperbolic plane geometry and trigonometry and elliptic plane geometry and trigonometry extensive appendixes offer background information on euclidean geometry

and numerous exercises appear throughout the text reprint of the holt rinehart winston inc new york 1945 edition

non euclidean geometry by henry parker manning is a comprehensive exploration of geometrical systems that deviate from euclidean geometry challenging traditional notions of space distance and parallel lines manning introduces readers to the fascinating world of non euclidean geometries providing insights into their development principles and applications key points manning introduces readers to the groundbreaking works of mathematicians like nikolai lobachevsky jános bolyai and carl friedrich gauss who pioneered the development of non euclidean geometries revolutionizing our understanding of geometric principles and expanding the boundaries of mathematical thought the book delves into the different types of non euclidean geometries such as hyperbolic and elliptic geometries presenting their distinctive properties axioms and geometric constructions manning explores the implications of these alternative geometries on concepts such as angles triangles and the nature of space itself non euclidean geometry offers readers a captivating journey into the realm of abstract mathematics challenging preconceived notions of geometric truth and illuminating the beauty and diversity of mathematical systems it is a valuable resource for mathematicians students and anyone fascinated by the profound exploration of the nature of space and geometry

geometry by construction challenges its readers to participate in the creation of mathematics the questions span the spectrum from easy to newly published research and so are appropriate for a variety of students and teachers from differentiation in a high school course through college classes and into summer research any interested geometer will find compelling material back cover

a versatile introduction to non euclidean geometry is appropriate for both high school and college classes its first two thirds requires just a familiarity with plane and solid geometry and trigonometry and calculus is employed only in the final part it begins with the theorems common to euclidean and non euclidean geometry and then it addresses the specific differences that constitute elliptic and hyperbolic geometry major topics include hyperbolic geometry single elliptic geometry and analytic non euclidean geometry

an introduction to non euclidean geometry covers some introductory topics related to non euclidian geometry including hyperbolic and elliptic geometries this book is organized into three parts encompassing eight chapters the first part provides mathematical proofs of euclid s fifth postulate concerning the extent of a straight line and the theory of parallels the second part describes some problems in hyperbolic geometry such as cases of parallels with and without a common perpendicular this part also deals with horocycles and triangle relations the third part examines single and double elliptic geometries this book will be of great value to mathematics liberal arts and philosophy major students

this resource is devoted to finite and non euclidean geometric systems for secondary school teachers and students

this book is a text for junior senior or first year graduate courses traditionally titled foundations of geometry and or non euclidean geometry the first 29 chapters are for a semester or year course on the foundations of geometry the remaining chapters may then be used for either a regular course or independent study courses another possibility which is also especially suited for in service teachers of high school geometry is to survey the fundamentals of absolute geometry chapters 1 20 very quickly and begin earnest study with the theory of parallels and isometries chapters 21 30 the text is self contained except that the elementary calculus is assumed for some parts of the material on advanced hyperbolic geometry chapters 31 34 there are over 650 exercises 30 of which are 10 part true or false questions a rigorous ruler and protractor axiomatic development of the euclidean and hyperbolic planes including the classification of the isometries of these planes is balanced by the discussion about this development models such as taxicab geometry are used extensively to illustrate theory historical aspects and alternatives to the selected axioms are prominent the classical axiom systems of euclid and hilbert are discussed as are axiom systems for three and four dimensional absolute geometry and pieri s system based on rigid motions the text is divided into three parts the introduction chapters 1 4 is to be read as quickly as possible and then used for reference if necessary

in this book dr coolidge explains non euclidean geometry which consists of two geometries based on axioms closely

related to those specifying euclidean geometry as euclidean geometry lies at the intersection of metric geometry and affine geometry non euclidean geometry arises when either the metric requirement is relaxed or the parallel postulate is replaced with an alternative one in the latter case one obtains hyperbolic geometry and elliptic geometry the traditional non euclidean geometries when the metric requirement is relaxed then there are affine planes associated with the planar algebras which give rise to kinematic geometries that have also been called non euclidean geometry the essential difference between the metric geometries is the nature of parallel lines euclid's fifth postulate the parallel postulate is equivalent to playfair's postulate which states that within a two dimensional plane for any given line l and a point a which is not on l there is exactly one line through a that does not intersect l in hyperbolic geometry by contrast there are infinitely many lines through a not intersecting l while in elliptic geometry any line through a intersects l another way to describe the differences between these geometries is to consider two straight lines indefinitely extended in a two dimensional plane that are both perpendicular to a third line in euclidean geometry the lines remain at a constant distance from each other meaning that a line drawn perpendicular to one line at any point will intersect the other line and the length of the line segment joining the points of intersection remains constant and are known as parallels in hyperbolic geometry they curve away from each other increasing in distance as one moves further from the points of intersection with the common perpendicular these lines are often called ultraparallels in elliptic geometry the lines curve toward each other and intersect

renowned for its lucid yet meticulous exposition this classic allows students to follow the development of non euclidean geometry from a fundamental analysis of the concept of parallelism to more advanced topics 1914 edition includes 133 figures

foundation of euclidean and non euclidean geometries according to f klein aims to remedy the deficiency in geometry so that the ideas of f klein obtain the place they merit in the literature of mathematics this book discusses the axioms of betweenness lattice of linear subspaces generalization of the notion of space and coplanar desargues configurations the central collineations of the plane fundamental theorem of projective geometry and lines

perpendicular to a proper plane are also elaborated this text likewise covers the axioms of motion basic projective configurations properties of triangles and theorem of duality in projective space other topics include the point coordinates in an affine space and consistency of the three geometries this publication is beneficial to mathematicians and students learning geometry

there are many technical and popular accounts both in russian and in other languages of the non euclidean geometry of lobachevsky and bolyai a few of which are listed in the bibliography this geometry also called hyperbolic geometry is part of the required subject matter of many mathematics departments in universities and teachers colleges a reflection of the view that familiarity with the elements of hyperbolic geometry is a useful part of the background of future high school teachers much attention is paid to hyperbolic geometry by school mathematics clubs some mathematicians and educators concerned with reform of the high school curriculum believe that the required part of the curriculum should include elements of hyperbolic geometry and that the optional part of the curriculum should include a topic related to hyperbolic geometry the broad interest in hyperbolic geometry is not surprising this interest has little to do with mathematical and scientific applications of hyperbolic geometry since the applications for instance in the theory of automorphic functions are rather specialized and are likely to be encountered by very few of the many students who conscientiously study and then present to examiners the definition of parallels in hyperbolic geometry and the special features of configurations of lines in the hyperbolic plane the principal reason for the interest in hyperbolic geometry is the important fact of non uniqueness of geometry of the existence of many geometric systems

a versatile introduction to non euclidean geometry is appropriate for both high school and college classes its first two thirds requires just a familiarity with plane and solid geometry and trigonometry and calculus is employed only in the final part it begins with the theorems common to euclidean and non euclidean geometry and then it addresses the specific differences that constitute elliptic and hyperbolic geometry major topics include hyperbolic geometry single elliptic geometry and analytic non euclidean geometry 1901 edition
