we present a new language feature specified as an extension to java the feature is a form of dispatch which includes and subsumes multimethods but which is not as powerful as general predicate dispatch it is however intended to be more practical and easier to use than the latter the extension dubbed oomatch allows method parameters to be specified as patterns which are matched against the arguments to the method call when matches occur the method applies if multiple methods apply the method with the more specific pattern overrides the others the pattern matching is very similar to that found in the case constructs of many functional languages with an important difference functional languages normally allow pattern matching over variant types and other primitives

such as tuples while oomatch allows pattern matching on java objects indeed the wider goal here is the study of the combination of functional and object oriented programming paradigms maintaining encapsulation while allowing pattern matching is of special importance class designers should have the control needed to prevent implementation details such as private variables from being exposed to clients of the class we here present both an informal tutorial description of oomatch as well as a formal specification of the language and a proof that the conditions specified guarantee run time safety
