fundamentals of heat and fluid flow in high temperature fuel cells introduces key concepts relating to heat fluid and mass transfer as applied to high temperature fuel cells the book briefly covers different type of fuel cells and discusses solid oxide fuel cells in detail presenting related mass momentum energy and species equation it then examines real case studies of hydrogen and methane fed sofc as well as combined heat and power and hybrid energy systems this comprehensive reference is a useful resource for those working in high temperature fuel cell modeling and development including energy researchers engineers and graduate students provides broad coverage of key concepts relating to heat transfer and fluid flow in high temperature fuel cells presents in depth knowledge of solid oxide fuel cells and their application in different kinds of heat and power systems examines real life case studies covering different types of fuels and combined systems including chp

one of the largest flows of energy in swedish municipalities is the fuel energy flow through the regional combined heat and power chp plant the customer products from this flow are mainly electricity to the electricity grid and heat to the building sector there are many ways to describe and examine this fuel energy flow and there are many perspectives this thesis presents one perspective it is a top down analytical and numerical perspective on the efficiency of heat and work in a regional energy system the analysis focus on the present situation in linköping municipality and aims at describing the energy efficiency improvement potential three subsystems are considered the regional production of electricity the regional production of heat and the regional public transport by bus these three systems are physically all heat engines i e engines that derive work and or heat from fuel combustion processes it is important to notice that the analysis in this thesis does not describe the theoretical improvement potential that potential is considerably higher than the implementable potential but of no practical use instead the analysis is as far as possible based on real world measured efficiencies and efficiency values of best practice best available technology the analysis shows that hardware investments at the chp plant can improve the electricity generation efficiency and thereby reduce co2 emissions the investments are in high pressure turbines medium pressure turbines and preheaters the size of the improvement is hard to quantify because it depends partly on unknown factors in the surrounding electricity market in the studied system co2 reduction could be as high as 40 60

the regionally produced biogas would be used more efficiently if it were used in the local combined cycle gas turbine instead of being used in internal combustion engines in buses the buses would instead be electrically driven this use of biogas would create a better integrated fuel energy flow and reduce heat losses another improvement is to reduce the system temperatures in the district heating system the study shows that the efficiency gains because of lower system temperatures would increase electricity production by about 13 and that greenhouse gas emissions would be reduced by 420 however these improvements are dependent on demand side investments in the district heating system and are therefore slow to implement ett av de största energiflödena i svenska kommuner är bränsle energi flödet genom det regionala kraftvärmeverket de konsumentprodukter som detta energiflöde producerar är främst uppvärmning av bostäder och elkraft det finns många sätt att beskriva och utvärdera detta bränsle energi flöde och det finns många olika perspektiv det här arbetet analyserar energiflödet med en analytisk top down metod analysen utgår ifrån den nuvarande situationen i linköpings kommun och avser att belysa den förbättringspotential som finns med avseende på systemets verkningsgrad tre delsystem har studerats det regionala systemet för värmeproduktion det regionala systemet för elproduktion och det regionala kollektivtrafiksystemet för innerstadstrafik med buss dessa tre system är fysikaliskt värmemotorer d v s de är system som nyttjar termisk energi från förbränningsprocesser för att utföra ett arbete och eller generera värme det är viktigt att notera att analyserna i detta arbete inte avser att beskriva en teoretisk förbättringspotential analyserna avser istället att belysa den praktiska implementerbara förbättringspotentialen därför har arbetet så långt som möjligt utgått ifrån uppmätta data och numeriska värden på verkningsgrader ifrån redan existerande anläggningar eller tekniska komponenter analyserna visar att hårdvaruinvesteringar i det lokala kraftvärmeverket skulle öka elproduktionen och därigenom sänka koldioxidutsläppen de investeringar som skulle behöva göras är investeringar i högtrycksturbiner mellantrycksturbiner och förvärmare de sänkta koldioxidutsläppen är svåra att kvantifiera eftersom de delvis beror på okända faktorer på den omgivande elmarknaden reduktionen av koldioxidutsläppen skulle kunna vara så stor som 40 60 den lokalt producerade biogasen skulle användas mer effektivt om den användes i den lokala gaskombi anläggningen istället för att användas som bussbränsle som är det nuvarande användningsområdet för detta bränsle bussarna skulle istället kunna ersättas med elbussar en sådan förändring av biogas användningen skulle innebära ett bättre integrerat energisystem med lägre värmeförluster en annan möjlig förbättring av kraftvärmesystemet är att sänka returtemperaturerna i fjärrvärmesystemet analyserna visar att elverkningsgraden skulle förbättras 13 och att koldioxidutsläppen skulle kunna minska med 420 dessa förbättringar skulle däremot kräva investeringar på

kraftvärmesystemets kundsida och bedöms därför vara långsamma att implementera
