how languages describe spatial motion events has been a hotly discussed topic in recent years in cognitive linguistics and linguistic typology this two volume book provides new descriptions and proposals on this fascinating topic based on a large scale experimental study of motion event descriptions in almost 20 languages across the globe as part of a research project conducted by ninjal the chapters are based on papers presented at international conferences most at ninjal international symposium held in january 2019 some at international cognitive linguistics conferences in 2017 and 2019 this volume provides valuable

descriptions of familiar and unfamiliar languages as well as insightful discussions of controversial issues based on those descriptions this book would interest students in linguistics and cognitive science in asia pacific europe and north america

a key element of any modern video codec is the efficient exploitation of temporal redundancy via motion compensated prediction in this book a novel paradigm of representing and employing motion information in a video compression system is described that has several advantages over existing approaches traditionally motion is estimated modelled and coded as a vector field at the target frame it predicts while this prediction centric approach is convenient the fact that the motion is attached to a specific target frame implies that it cannot easily be re purposed to predict or synthesize other frames which severely hampers temporal scalability in light of this the present book explores the possibility of anchoring motion at reference frames instead key to the success of the proposed reference based anchoring schemes is high quality motion inference which is enabled by the use of a more physical motion representation than the traditionally employed block motion fields the resulting compression system can support computationally efficient high quality temporal motion inference which requires half as many coded motion fields as conventional codecs furthermore features beyond compressibility including high scalability accessibility and intrinsic framerate upsampling can be seamlessly supported these features are becoming ever more relevant as the way video is consumed continues shifting from the traditional broadcast scenario to interactive browsing of video content over heterogeneous networks this book is of interest to researchers and professionals working in multimedia signal processing in particular those who are interested in next generation video compression two comprehensive background chapters on scalable video compression and temporal frame interpolation make the book accessible for students and newcomers to the field
