the lipases and phospholipases represent a diverse group of enzymes that are expressed in animals plants fungi and bacteria their ubiquitous distribution among all species is a testament to the essential roles played by these

enzymes in lipid storage mobilization and metabolism membrane homeostasis and remodeling endocrine and immune functions and signal transduction in humans lipases and phospholipases are also thought to contribute to complex diseases such as atherosclerosis obesity arthritis and cancer as well as to single gene defects such as wolman's disease and type i hyperlipoproteinemia enzymatically the lipases are unique since they hydrolyze substrates that are either insoluble or only partly soluble in aqueous solvents thus enzyme catalysis takes place at a lipid water interface the interface comprises at least two and often more discrete bulk and surface phases in which the enzyme substrate and products of lipolysis disperse among these phases based on their physical properties furthermore the distribution of these components changes continuously as lipolysis proceeds thus the lipases and phospholipases are fundamentally different from any other enzyme because of the physical complexity of the environment in which catalysis occurs
