ignorance and uncertainty overviews a variety of approaches to the problem of indeterminacies in human thought and behavior this book examines in depth trends in the psychology of judgment and decision making under uncertainty or ignorance research from the fields of cognitive psychology social psychology organizational studies sociology and social anthropology are reviewed here in anticipation of what dr smithson characterizes as the beginning of a creative dialogue between these researchers ignorance and uncertainty offers the conceptual framework for understanding the paradigms associated with current research it discusses the ways in which attitudes toward ignorance and uncertainty are changing and addresses issues previously ignored

the recent global financial crisis has made the inadequacies of the scientific state of economics and finance glaringly obvious as these disciplines gave the false reassurance that such a self destructive phenomenon could not happen a similar phenomenon arose in the 1930 s when the pitfalls of the dominant economic theories were sharply exposed since then the same analytical framework in its new versions has revealed a huge number of other empirical and experimental failures on the other hand the founders of the currently dominant theories in economics and finance i e the standard paradigm such as walras 1834 1910 modigliani 1918 2003 and miller 1923 2000 have identified mathematical contradictions within their own foundational models the root cause of which no one has yet discovered the standard paradigm has thus lost the reason for its existence in the light of experience experiments and logical rigour this book identifies the heuristic cause of these external and internal contradictions of the standard paradigm and remedies these problems by offering a new paradigm which can explain and predict observed economic behaviour and resolve the extant behavioural empirical and experimental puzzles the new paradigm offers a dramatically improved understanding of economic behaviour at the micro as well as macro level of the economy within an overarching framework comprising the real and the financial sectors it does so in a rigorous but simple and clear way using an axiomatic approach it also offers policy recommendations on how the economy should be managed to avoid severe swings it therefore is of great interest to scholars and practitioners in economics and finance

the last two decades have witnessed an enormous growth with regard to applications of information theoretic framework in areas of physical biological engineering and even social sciences in particular growth has been spectacular in the field of information technology soft computing nonlinear systems and molecular biology claude shannon in 1948 laid the foundation of the field of information theory in the context of communication theory it is in deed remarkable that his framework is as relevant today as was when he first proposed it shannon died on feb 24 2001 arun netravali observes as if assuming that inexpensive high speed processing would come to pass shannon figured out the upper limits on communication rates first in telephone channels then in optical communications and now in wireless shannon has had the utmost value in defining the engineering limits we face shannon introduced the concept of entropy the notable feature of the entropy framework is that it enables quantification of uncertainty present in a system in many realistic situations one is confronted only with partial

or incomplete information in the form of moment or bounds on these values etc and it is then required to construct a probabilistic model from this partial information in such situations the principle of maximum entropy provides a rational basis for constructing a probabilistic model it is thus necessary and important to keep track of advances in the applications of maximum entropy principle to ever expanding areas of knowledge

seeking sustainability in an age of complexity explains the difficulties of sustainability and why collapse can occur in the last twenty years the theory of complexity has been developed complex systems science css speaks to natural systems and particularly to ecological social and economic systems and their interaction due to the growing concern over the huge changes occurring in the global environment such as climate change deforestation habitat fragmentation and loss of biodiversity graham harris sets out what has been learned in an attempt to understand the implications of these changes and suggests ways to move forward this book discusses a number of emerging tools for the management of unruly complexity which facilitate stronger regional dialogues about knowledge and values which will be of interest to ecologists sociologists economists natural resource managers and scientists in state and local governments and those involved in water and landscape management

communication failures are ubiquitous exacerbating the situation much communication advice is superficial and the vast research base that should inform best practices in communication is difficult to navigate beyond the sage on the stage translates lessons from carefully documented scholarship into lucid prose with meaningful examples that illustrate readily applicable communication strategies this user friendly guide provides a unique cross disciplinary approach to developing the knowledge skills and habits of mind to achieve evolving communication goals topics include optimizing language and visuals designing comparisons composing logic stories conveying authenticity clarifying data and uncertainty supporting reasoning and decision making avoiding backfires reading body language and cultivating empathy the book is constructed with a clear progression of logic based on a proven educational framework and provides guidance for communication about both uncontroversial and controversial topics demonstrating how commonly dispensed communication advice is often counterproductive beyond the sage on the stage is an innovative toolkit for being understood fostering trust and genuine connection and building a foundation for more effective inclusive communication

topics in this book range from mathematical theories to probabilistic analysis of structures in civil engineering mathematical background is first covered including probabilistic and possibilistic conceptualization of uncertainty the algebraic structure of conditional reasoning

uncertainty modeling in anticipatory systems reasoning by hypothesizing causal models fuzzy sets and truth functionality the second part deals with expert systems and neuronal structures and includes papers on expert appraisal and counter appraisal with experton processes the management of uncertainty transferable belief models for expert judgement fuzzy neural expert systems and inverse dynamic adaptive control of particular interest is the last section which deals with applications in engineering the articles presented here show just how far this field has progressed from theory to practice they deal with such topics as the prediction of earthquake ground motion and structural responses bridge ratings safety and reliability evaluations of transmission lines and transportation

the author here explores the place of talk or actually talk in interaction in pilots execution of their duties he also considers how pilots talk and interact with one another as they establish what is going on around them and decide on appropriate courses of action

new paradigms for treating relationships is a contemporary international perspective on the theory and practice of analytic couple and family therapy it summarizes theory sets it in context and illustrates the concepts with clinical illustrations this clearly written and engaging book is essential for practicing couple and family therapists psychotherapists and psychoanalysts teachers of psychotherapy as well as for students of psychoanalysis and philosophy

in an era increasingly dominated by new technologies there are many calls for regulation to control their application this timely contribution reviews and develops the role of human rights in the regulation of new technologies discussing how rights are affected by technological development and how they can be used to improve regulation

andrew bennett argues in this fascinating book that ignorance is part of the narrative and poetic force of literature and is an important aspect of its thematic focus ignorance is what literary texts are about he sees that the dominant conception of literature since the romantic period involves an often unacknowledged engagement with the experience of not knowing from wordsworth and keats to george eliot and charles dickens from henry james to joseph conrad from elizabeth bowen to philip roth and seamus heaney writers have been fascinated and compelled by the question of ignorance including their own bennett argues that there is a politics and ethics as well as a poetics of ignorance literature s agnology its acknowledgement of the limits of what we know both of ourselves and of others engages with the possibility of democracy and the ethical and allows us to begin to conceive of what it might mean to be human this exciting approach to literary theory will be of interest to lecturers and students of literary theory and criticism
