this is the first book to collect and summarize in one publication the efforts to use kinases or phosphatases for drug development against parasite infections the editors and contributors comprise the who is who in the field and they are comprehensive in covering every aspect of the topic from basic research findings to translational approaches in drug development the result will be welcomed by everyone in academia and industry participating in the global effort to finally combat the major diseases caused by eukaryotic parasites this is volume one of a two volume treatise the second being exclusively dedicated to efforts to combat malaria using the same approach

this book examines applications of multi omics approaches for understanding disease etiology pathogenesis host pathogen interactions it also analyzes the genetics immunological and metabolic mechanisms underlying the infections the book also explores genomics transcriptomics translational omics and metabolomics approaches to understand the pathogenesis and identify potential drug targets it reviews the role of epigenetic reprogramming in shaping the host pathogen interactions and presents bioinformatics application in the identification of drug targets

further it examines the potential applications of rna sequencing and non coding rna profiling to identify the pathogenesis lastly it offers the current challenges technological advances and prospects of using multi omics technologies in infectious biology

this new edition describes the role of heat shock proteins in the life cycle of malaria parasites particularly in the context of intracellular parasite stages thoroughly revised this work provides a general introduction to the structural and functional features of heat shock proteins with a special focus on their role as molecular chaperones in ensuring protein quality control the emphasis is on the heat shock protein families from plasmodium falciparum and their role in proteostasis and the development of malaria pathology moreover the authors explore the latest prospects of targeting heat shock proteins in antimalarial drug discovery either directly or in combination therapies readers will experience a functional analysis of the individual families of heat shock proteins and their cooperation in functional networks including both the parasite resident proteome and the exportome released into host cells during intracellular stages subcellular and extracellular organelles such as the apicoplast and the maurer s clefts associated with plasmodium species are discussed in detail the book highlights the role of heat shock proteins in the development and function of these structures biochemical expertise and the inclusion of novel therapeutic solutions make this collection a unique reference for experts in heat shock protein research parasitology and infectious diseases cell stress molecular biology and drug discovery not least advances in malaria control will contribute to ending epidemics and ensuring healthy lives in line with the un sustainable development goals

national institute of allergy and infectious diseases nih volume 2 impact on global health covers the scientific aspects of the entire portfolio of niaid including microbiology and infectious disease hiv aids and immunology and vaccines all major diseases and the relevant immunology and

vaccine development are described in detail in addition all major niaid programs initiatives and clinical trials are discussed and illustrate the global involvement of niaid in biomedical research and its impact on public health worldwide by providing this information the global scientific community will be able to access and benefit from these programs and initiatives
