this encyclopaedia of mathematics aims to be a reference work for all parts of mathematics it is a translation with updates and editorial comments of the soviet mathematical encyclopaedia published by soviet encyclopaedia publishing house in five volumes in 1977 1985 the annotated translation consists of ten volumes including a special index volume there are three kinds of articles in this encyclopaedia first of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used the main requirement for these articles has been that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible on the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science engineers and teachers of mathematics these articles treat their material at a fairly general level and aim to give an idea of the kind of problems techniques and concepts involved in the area in question they also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions the second kind of article of medium length contains more detailed concrete problems results and techniques

this book is meant as a text for a first year graduate course in analysis any standard course in undergraduate analysis will constitute sufficient preparation for its understanding for instance my undergraduate analysis i assume that the reader is acquainted with notions of uniform convergence and the like in this third edition i have reorganized the book by covering integration before functional analysis such a rearrangement fits the way courses are taught in all the places i know of i have added a number of examples and exercises as well as some material about integration on the real line e g on dirac sequence approximation and on fourier analysis and some material on functional analysis e g the theory of the gelfand transform in chapter xvi these upgrade previous exercises to sections in the text in a sense the subject matter covers the same topics as elementary calculus viz linear algebra differentiation and integration this time however these subjects are treated in a manner suitable for the training of professionals i e people who will use the tools in further investigations be it in mathematics or physics or what have you in the first part we begin with point set topology essential for all analysis and we cover the most important results

introduction to riemann surfaces for graduates and researchers giving refreshingly new insights into the subject

the space of all riemann surfaces the so called moduli space plays an important role in algebraic geometry and its applications to quantum field theory this book focuses on the study of topological properties of this space and of similar moduli spaces such as the space of real algebraic curves and the space of mappings

in this volume the authors present some new trends in real algebraic geometry based on the study of arc spaces and additive invariants of real algebraic sets generally real algebraic geometry uses methods of its own that usually differ sharply from the more widely known methods of complex algebraic geometry this feature is particularly apparent when studying the basic topological and geometric properties of real algebraic sets the rich algebraic structures are usually hidden and cannot be recovered from the topology the use of arc spaces and additive invariants partially obviates this disadvantage moreover these methods are often parallel to the basic approaches of complex algebraic geometry the authors presentation contains the construction of local topological invariants of real algebraic sets by means of algebraically constructible functions this technique is extended to the wider family of arc symmetric semialgebraic sets moreover the latter family defines a natural topology that fills a gap between the zariski topology and the euclidean topology in real equisingularity theory kuo s blow analytic equivalence of real analytic function germs provides an equivalence relation that corresponds to topological equivalence in the complex analytic set up among other applications arc symmetric geometry via the motivic integration approach gives new invariants of this equivalence allowing some initial classification results the volume contains two courses and two survey articles that are designed for a wide audience in

particular students and young researchers

unique in its approach the lehmann algebra series uses curve fitting to model compelling authentic situations while answering the perennial question but what is this good for lehmann begins with interesting data sets and then uses the data to find models and derive equations that fit the scenario this interactive approach to the data helps readers connect concepts and motivates them to learn the curve fitting approach encourages readers to understand functions graphically numerically and symbolically because of the multi faceted understanding that they gain readers are able to verbally describe the concepts related to functions

this book brings together recent research work on algebraic specification as which aims to provide formal techniques for the specification and prototyping of software
